

# Cypher Industries – Ethereum’s Community-Owned Liquidity Hub

*Cypher Industries’ logo, reflecting its Ethereum-centric, community-owned ethos.*

**Cypher Industries** (aka “**Cypher Ethereum**”) is a new decentralized exchange (DEX) and token launch platform built exclusively on **Ethereum Layer-1**. It launched on Ethereum mainnet in November 2025 with a unique “**Genesis Pools**” event for early community distribution <sup>1</sup>. The project aims to realign Ethereum’s liquidity markets by **eliminating venture capital influence** and **putting ownership in the hands of users** <sup>2</sup>. In contrast to many VC-backed protocols, Cypher is *purpose-built for Ethereum* and **entirely community-driven** – over 70% of its \$CYPH token supply is allocated to the community <sup>3</sup>.

## Key Features and Architecture

- **Next-Gen AMM Engine:** Cypher implements a “**Uniswap v4-like**” **concentrated liquidity AMM** (Automated Market Maker), built on the Algebra v1.2 engine. This offers **highly customizable liquidity ranges and plugin modules** (similar to Uniswap’s hooks) for features like dynamic fees <sup>4</sup>. The design is **gas-efficient** and has been **battle-tested with over \$50 billion in volume** through its underlying codebase <sup>4</sup>.
- **Versatile Liquidity Pools:** The protocol supports *two types of AMMs* – a classic constant-product AMM (**V2**) and the advanced concentrated liquidity AMM (**V4**). This dual approach allows both traditional liquidity pools and concentrated range pools, catering to different assets and preferences <sup>5</sup>. A universal **Aggregator/Router** contract ties these together, routing trades across V2 and V4 pools for optimal pricing <sup>6</sup>.
- **Audited & Battle-Tested Code:** Cypher’s core smart contracts are **derived from the Camelot DEX** (a proven Arbitrum-based DEX) and inherit Camelot’s **audited architecture** <sup>7</sup>. Camelot’s code was independently audited by Paladin and has been **battle-tested on Arbitrum for 3+ years** <sup>7</sup>. All of Cypher’s custom upgrades and new modules were **re-audited by security firm BailSec** before launch <sup>8</sup>. Moreover, the Algebra v1.2 engine powering Cypher’s V4 AMM underwent **comprehensive audits by MixBytes and BailSec**, ensuring the new AMM model meets modern DeFi security standards <sup>9</sup>.
- **Integrated Launchpad (Capital Formation):** Beyond the DEX, Cypher features a **permissionless launchpad** for decentralized fundraising. It supports **fair launches, fixed-price sales, and bonding-curve token sales** – allowing new projects to raise capital in a fair, customizable manner <sup>10</sup>. The protocol’s **Factory** contract enables anyone to create a new token, which is then **automatically seeded into Cypher’s AMM liquidity** on launch <sup>10</sup>. This seamless coupling of token launches with liquidity provisioning makes Cypher a one-stop platform for launching and trading new assets.
- **Ethereum Alignment:** Cypher is **exclusive to Ethereum L1**, focusing all efforts on Ethereum’s ecosystem rather than cross-chain expansion <sup>11</sup>. By forgoing VC funding and private sales, and distributing revenues to token stakers, it aligns with Ethereum’s grassroots ethos (hence the

motto “*Make Ethereum Cypherpunk Again*”) <sup>12</sup> . All protocol fees are returned to the community (via the token model described below), reinforcing a user-owned infrastructure.

## Launch Plan and Tokenomics

Cypher’s token (\$CYPH) had **no pre-sale or early investor allocation** – instead, the supply is being distributed through a fair community-centric launch. **As of mid-November 2025, the \$CYPH token is not yet live or tradable** (any token claiming to be \$CYPH is unofficial) <sup>13</sup> . The rollout is happening in three phases:

1. **Genesis Pools (Nov 2025 – Jan 2026):** To bootstrap liquidity and reward early adopters, Cypher launched an 8-week “*Genesis Pools*” event starting November 10, 2025 <sup>14</sup> <sup>15</sup> . Users who provide liquidity to specified V4 pools or trade on the DEX earn **Points** on a leaderboard <sup>15</sup> . **5% of the total \$CYPH supply** is allocated as rewards for this event <sup>15</sup> . These Points will **convert into Cypher’s incentive token “oCYPH”** at the end of the 8 weeks <sup>16</sup> , giving participants a claim on future \$CYPH. (Optionally, *oCYPH can be converted 1:1 into locked \$xCYPH, or redeemed for liquid \$CYPH by paying a small fee in ETH* <sup>17</sup> .) Notably, Points earned during the first 4 weeks also grant a **whitelist allocation** for the upcoming token sale <sup>18</sup> – incentivizing early participation. Certain Ethereum NFT community members (e.g. holders of Redacted Remilio, Milady, etc.) were even given a **+15% points boost** (snapshot-based) to encourage a diverse user base <sup>19</sup> <sup>20</sup> .
2. **Fair-Launch Token Sale (Early Dec 2025):** Once the Genesis Pools campaign is halfway through, Cypher will conduct a **public token sale** in early December <sup>18</sup> . This sale is a **fixed-price fair launch** at the project’s seed valuation (i.e. the price VCs might have paid, but opened to the public) <sup>21</sup> . **10% of \$CYPH’s supply** is allocated for this sale <sup>21</sup> . Whitelisted community members (those who earned points in the first month) are guaranteed an allocation to purchase \$CYPH <sup>18</sup> . This approach ensures a wide distribution without insider advantages. **Until this sale occurs, no \$CYPH tokens exist in circulation** – reinforcing that *the project has “no token yet” prior to December 2025* <sup>13</sup> .
3. **Full Protocol Launch (Late Dec 2025):** After the fair-launch sale, the \$CYPH token will become **live and freely tradable** on the open market <sup>22</sup> . This marks the full launch of the Cypher protocol: liquidity mining **incentives will kick in**, with liquidity providers earning \$CYPH (via oCYPH) on top of trading fees <sup>22</sup> <sup>23</sup> . The **launchpad features and staking (xCYPH)** will also activate alongside the DEX <sup>22</sup> . At the conclusion of the 8-week Genesis period (around early January 2026), an **airdrop will distribute the earned oCYPH** to all participants, finalizing the initial community ownership distribution <sup>23</sup> . Going forward, all liquidity mining rewards will be given as oCYPH (which, as noted, must be vested or converted), to promote long-term alignment rather than immediate sell pressure <sup>24</sup> .

**\$CYPH Token Model:** Cypher employs a **three-tier token system** inspired by Camelot’s model, designed for sustainable value accrual <sup>25</sup> :

- **\$CYPH:** The **liquid utility token** of the ecosystem. This is the tradable token used for governance and as the base asset on the Cypher DEX (e.g. paired with ETH in pools) <sup>26</sup> . Once live, it will capture value from the platform’s growth, but most protocol revenue is routed to xCYPH (see below).
- **\$xCYPH:** The **locked staking token** (think of it as staked/escrowed \$CYPH). Users can lock \$CYPH into \$xCYPH, typically with a vesting period (e.g. 6 months) <sup>26</sup> . In return, **100% of**

**trading fees and launchpad revenues are distributed to xCYPH holders** as real yield <sup>27</sup>. By directing all protocol fees to the locked token, Cypher creates a strong incentive to hold and lock tokens, thereby **reducing circulating supply and rewarding long-term participants** <sup>28</sup>.

- **\$oCYPH:** The “**option**” or **reward token** earned from liquidity mining and other incentives. Instead of paying out rewards in immediately sellable \$CYPH, Cypher emits \$oCYPH <sup>26</sup>. \$oCYPH cannot be directly traded; it must be **converted 1:1 into \$xCYPH (locked)** or **redeemed for \$CYPH by paying a fee in ETH** (the ETH paid is used to buy back \$CYPH on the market) <sup>29</sup>. This mechanism significantly **mitigates sell pressure** from farming rewards, as most farmers will either take the locked token (aligning them with the protocol long-term) or pay a penalty to get liquid tokens, which supports the token value <sup>30</sup>. Overall, the tri-token system aligns incentives such that active users become stakeholders and benefit from the protocol's success.

## Mainnet Deployment and Security

The Cypher protocol is **deployed on Ethereum mainnet**, and the team has published the verified contract addresses for transparency <sup>31</sup>. Key contracts include the AMM factories/routers (for both V2 and V4), liquidity management tools, and launchpad contracts. For reference, the **official mainnet addresses** are listed below <sup>6</sup> <sup>32</sup>:

- **Factory V2:** 0xCc8e4C2998395E56D06D985ba791138Edf48a8d4
- **Router V2:** 0xAfDf0EBC71AfCD38070A9fb5ceCF9a932CbCC46f
- **Factory V4:** 0xfb8Ed3485EfA29a0e4bed93351dD51B59fC4b0f0
- **NFT Position Manager (V4):** 0x0a984a446A116335ac90425d2D1E69A7199A2f7c
- **Quoter V4:** 0x02f22D58d161d1C291ABfe88764d84120f20F723
- **Router V4:** 0x20C5893f69F635f55b0367C519F3f95e59c0b0Ab
- **Aggregator:** 0x37CA43556BB981ca6827b4A92369a28Eb61995E3
- **Campaign Factory (Launchpad):** 0xCaf7D2AE2c8dE1512B2BD392Eebb0B95192b2262
- **Distributor:** 0x2a7B9E22A76eDEc50167590Fd3198b27040362d4

(As noted, there is no \$CYPH token contract yet in this list – the token will be deployed at launch time; any contract currently claiming to be \$CYPH is not official.) The presence of both V2 and V4 factories in the deployment confirms Cypher’s dual-AMM design. All contracts are **verified on Etherscan**, allowing the community to review the code.

**Security & Audits:** Cypher has emphasized security by building on audited foundations and conducting new audits for its custom code. The core AMM contracts (the V2 AMM and related components) are forked from Camelot’s code, whose design was audited by **Paladin Blockchain Security** in late 2022 <sup>33</sup>. Camelot’s implementation on Arbitrum has processed billions in volume over several years without major incident, lending confidence to Cypher’s base layer. On top of this, Cypher made various optimizations and additions (e.g. the launchpad modules and token contracts), all of which were **re-audited by BailSec in 2023** prior to deployment <sup>8</sup>. The newer V4 AMM leverages the Algebra (Integral) engine – a cutting-edge concentrated liquidity model – which had **independent audits by MixBytes and BailSec** for its core architecture <sup>9</sup>. By combining **proven audited code with fresh security reviews**, Cypher set a strong security foundation. Additionally, the team employs standard best practices (e.g. likely using multisig wallets for admin keys, time-locks on governance changes, etc.) to further safeguard the protocol (as implied by the presence of a “Multisigs” section in their docs). Overall, security has been treated as a first-class priority in the rollout of Cypher.

## Outlook

With its mainnet launch underway, Cypher Industries is positioning itself as the **“engine of Ethereum capital markets,”** providing a decentralized, community-first alternative to entrenched trading venues. Early support from the Arbitrum DeFi community – for instance, Camelot DEX publicly endorsed Cypher and even extended an airdrop to its *xGRAIL* stakers as Cypher went live <sup>1</sup> – underscores the excitement for an Ethereum-aligned project with no venture backing. By **making Ethereum’s liquidity infrastructure explicitly cypherpunk and community-owned**, Cypher aims to **usher in a new era of grassroots innovation on Ethereum** <sup>12</sup>. Its roadmap promises continual evolution (from advanced AMM features like on-chain limit orders and lending, to eventual protocol decentralization and an ecosystem accelerator fund) <sup>34</sup> <sup>35</sup>. If successful, Cypher could become a core pillar of Ethereum’s DeFi stack – **a home-grown marketplace owned by its users**, where the value created on Ethereum stays with the Ethereum community.
