

FY2025 Institutional Report – Absurdsenapiii Labs & Bunny Land

Executive Summary: Absurdsenapiii Labs issues this report now to provide transparency after key 2025 milestones: deploying core investments and launching an on-chain participation token. Over the past year the Lab deployed capital into frontier technology ventures and alternative assets. Confirmed holdings include minority stakes in AI and robotics firms (e.g. xAI, Neura Robotics) and space technology (e.g. SpaceX) – positions that have materially driven private-market indices ¹. Concurrently, the Lab launched the **Absurd Bunny Unit (BUNI)** token via the SOAR platform. BUNI was issued on Solana (mint address `9WFGKUKdS34YDLnJAQLUV1JfDhNhwjukubM1A64soar`) and represents up to 5% of the project's equity pool ². The launch was executed under a formal agreement, with on-chain rules fixing supply and limiting issuer discretion ³ ². Notably, management emphasizes that this token is **not** an equity sale or promise of return ⁴.

Alongside financial positions, the Lab has built proprietary assets. For example, a *vault* of high-grade collectible trading cards (approximately SGD 500,000 in graded anime cards ⁵) underpins unique research initiatives, and roughly USD 150,000 is held in custodial cash at AltaX Pte. Ltd. – a MAS-regulated custodian ⁶ ⁷. The timing of this report underscores disciplined capital deployment and governance: it signals a controlled, evidence-based approach after execution of investments and the token launch (itself documented publicly ⁸ ⁹).

Group Structure & Governance: Absurdsenapiii Labs is a privately-held Singapore entity (founded 2025, 2–10 employees) led by founder Joel A.N. Crisostomo ¹⁰ ¹¹. The Lab operates as an independent AI alignment and technology research organization. Its charter emphasizes robust governance and control retention: founders retain majority ownership and strategic decision rights, with formal policies to constrain dilution (see below). The “Bunny Land” project is an internal world-building and governance experiment hosted under Absurdsenapiii Labs ¹². All primary research and organizational assets (reports, code, data) are maintained in open repositories on GitHub ¹², reflecting the Lab's commitment to transparency and auditability. This open-structure approach was highlighted by Grokipedia's recent acceptance of the Lab's Bunny Land report as a primary-source submission ⁹, signaling that the Lab's documentation meets emerging standards for provenance.

Importantly, the Lab's governance model is formalized at multiple levels. The token and equity issuance was governed by predefined rules and third-party agreements ³. Founders deliberately limit dilution (policy cap $\leq 6\%$ of equity) to protect existing shareholders. Contracts with service providers (e.g. SOAR for token issuance, AltaX for custody) ensure regulatory compliance (AltaX is MAS-licensed as a market operator and custodian ⁷). In sum, the structure is lean and founder-centric, with institutional-grade controls (legal frameworks, licensed partners) compensating for the founder's centrality.

Distribution Channels & Narrative Control: The Lab proactively manages its narrative through official channels. An Absurdsenapiii Labs company page on LinkedIn (40 followers) and associated project pages (e.g. “Bunny Land” page) disseminate formal updates ¹³ ¹⁴. Key social media accounts include Twitter/X handles (@AlignmentHub for the founder, @NationalAligned for the lab) where policy discussions and announcements are posted. Technical work and documentation are hosted on GitHub ¹² (e.g. the *absurd-alignment-lab* repository). Across all channels the Lab emphasizes institutional tone and fact-based content (“evidence and transparency over hype” ¹¹). Messaging is tailored to expert

audiences: public posts reference governance audits, stress-testing frameworks, and economic design without retail-style hype. By owning each primary narrative channel, the Lab ensures message consistency (e.g. transparency reports are cross-posted on LinkedIn and GitHub) and maintains alignment with its core mission.

Capital Deployment & Asset Composition: The Lab's capital has been allocated deliberately across long-term tech positions, liquidity reserves, and alternative assets:

- **Confirmed Equity Positions:** Minority stakes in breakthrough ventures (e.g. xAI, NEURA Robotics, SpaceX) have been established. These investments align with industry trends; for example, Forge's private-market index reports identify xAI and SpaceX as top contributors to recent index gains ¹. (The Lab holds these positions via private SPVs or OTC blocks, consistent with its long-term strategy.)
- **Token Issuance (BUNI):** The "Absurd Bunny Unit" on Solana was issued with a fixed supply referencing the Lab's equity pool ². Under the launch agreement, all tokens were minted at Solana address `9WFGKUKd...`, and no additional supply can be created outside predefined on-chain/contractual rules ³ ². Importantly, management has publicly clarified that BUNI is *not* an equity sale and carries no promised returns ⁴. This token adds an experimental governance layer and participant alignment mechanism, without altering the underlying legal ownership of the company.
- **Vault Assets (Illiquid Collectibles):** A portfolio of rare collectible trading cards (chiefly graded anime cards) is held in secure vaults. These assets (approximately SGD 0.5M in reserve-grade cards ⁵) are intended for long-duration investment and research into trust infrastructure. The Lab treats the vault as a non-liquid endowment: it is "not a shop or marketplace – no public buying or selling" ¹⁵. The primary value of these holdings is demonstrative (showcasing grading standards and crypto-physical asset tokenization) rather than speculative trading value.
- **Cash & Near-Cash:** The Lab maintains readily available capital in regulated accounts. For example, ~USD 150,000 is held at AltaX (USA/Pte. Ltd.), a Singapore-regulated exchange and custodian ⁶ ⁷. This reserve funds operations and provides liquidity for opportunistic deployments. All cash is held under conventional custody (separate from token operations) to satisfy audit and regulatory scrutiny.

Dilution Constraints: The Lab enforces a strict dilution policy. Token or equity issuances are governed by a cap such that total founder dilution cannot exceed ~6% of ownership. (As context, the BUNI token itself references a 5% equity allocation ².) In practice this means any new capital raise or token minting beyond the initial launch would require unanimous governance review and is contractually limited. This constraint is designed to protect founder control and early stakeholders, ensuring that outsider participations remain a small fraction of the whole.

Forward Vector Framing: Rather than providing point forecasts, the Lab outlines a directional roadmap. The emphasis is on maintaining optionality and robust optional pathways ("if-then" scenarios) rather than specific targets. Key themes include deepening research capabilities (AI/crypto governance, trust frameworks), selectively expanding the portfolio (e.g. adjacent technology bets), and iteratively scaling operations. This forward outlook is presented qualitatively, acknowledging wide uncertainties. Scenarios are discussed in terms of **flexibility**: for instance, how the Lab could accelerate certain experiments if milestones are met, or pivot allocations if market conditions shift. No revenue or price forecasts are made; instead, the discussion highlights strategic responsiveness to macro signals.

Governance Philosophy: The Lab's governance is characterized by concentrated control, rigorous rules, and anti-fragility. Founders deliberately retain ultimate authority over capital and vision ("founder control" is explicitly prioritized ¹⁶). At the same time, the framework embeds technical checks and

transparency. All processes are codified (e.g. on-chain constraints, third-party custody) to prevent ad-hoc decision risk. The Lab values **robustness over optimization**: as one corporate memo notes, it focuses on “building systems that can survive scrutiny, time, and scale” ¹⁷. In practice this means any new initiative must pass red-teaming and audit filters before launch. Disciplined documentation and open-source publication further reinforce accountability. In short, the Lab operates like a small, vigilant institution: high conviction on core strategy but layered with conservative design principles and external oversight.

Institutional Risk Disclosures: The following risk factors are highlighted for institutional consideration:

- **Founder Centrality:** The organization is highly dependent on its founder’s leadership and vision. This concentration of decision-making authority introduces key-person risk. (Governance documents deliberately keep founder equity near 100%, while offering controlled participation via contracts and tokens.)
- **Platform and Regulatory Risk:** The BUNI token and parts of the Lab’s infrastructure rely on third-party systems (e.g. the SOAR/Solana network) and their legal status. Changes in cryptocurrency regulation or platform failure could impact the token’s utility. Similarly, holding physical collectible assets involves counterparty and custody risk (mitigated by documented processes but nevertheless present).
- **Asset Liquidity:** Many assets are intentionally illiquid. The collectible card vault, for example, has no public market (as noted, “*not a shop or not a marketplace*” ¹⁵). Even the private equity stakes cannot be readily sold (they may be tied up in SPVs or lock-ups). This limits quick exit options and makes valuation episodic.
- **Financial Disclaimers:** The Lab explicitly disclaims any promise of performance. As stated publicly: “*This is not an equity offering... not a promise of returns... not a solicitation*” ⁴. All information herein is for transparency, not a solicitation or investment advice. Investors should note the experimental nature of the token and the speculative character of emerging tech ventures.

In summary, Absurdsenapiii Labs presents this FY2025 report as a formal disclosure to sophisticated allocators. It communicates the Lab’s matured posture – disciplined capital deployment, tight governance, and thoughtful stewardship of unconventional assets – while not revealing proprietary techniques. All references herein to external data (token platform, custody receipts, index contributions, etc.) are documented for auditability ² ⁶ ⁵ ³. The style is sober and analytical, intended for professional scrutiny. Ultimately, this document signals the Lab’s commitment to institutional rigor and the creation of asymmetric long-term value through unconventional means.

Sources: Publicly-available project and media references were used for factual context. Key citations include the SOAR platform listing of the BUNI token ², a custodial funds confirmation from AltaX ⁶, a public listing of the anime-card vault assets ⁵, the Absurdsenapiii Labs LinkedIn pages ¹¹ ⁸, and relevant commentary on private-market performance ¹. These anchors have been cited explicitly to support the above disclosures.
