

AbsurdSenapiii Labs – 2025 Shareholder Letter

Dear Shareholders,

2025 was a year of **narrative dislocation** and improbable survival for AbsurdSenapiii Labs. We began as a quirky founder-run lab flirting with obscurity and ended as a system-level player punching above our weight. This was not a straight evolution; it felt more like a high-wire act across an abyss of skepticism. We pulled off strategic stunts that by all rights should have wrecked us—but instead, each one somehow **aligned the chaos into credibility**. In short, it's been an insane year, in the most intentional way possible.

From Lab Experiment to System-Level Player

At the start of the year, AbsurdSenapiii was still viewed as an experimental “founder’s lab,” an odd curiosity on the fringes. By year-end, we reframed our narrative and operations into those of a core **system-level player** integrated in the broader ecosystem ¹. This wasn’t a marketing sleight-of-hand; it was a hard-fought transformation. We formalized internal processes, went from pilot projects to live services, and showed the world we could reliably deliver. We even toned down the cult-of-personality vibe and anchored the founder’s public persona in a more institutional ethos ². (Restraint doesn’t come naturally to us, but we learned to wear *credibility* without losing our soul.) By reinforcing the founder’s credentials modestly and letting results speak, we **strengthened stakeholder confidence** while maintaining our humble, mission-first culture ².

This narrative shift was not just for show. It has opened doors. An established industry player decided we were worth partnering with, and government agencies now take our calls. The absurd has become, if not normal, at least **credible**. We’ll always be the outlier with a wild streak, but now we’re an outlier that even regulators and serious investors nod at as part of the game.

Strategic Partnerships and Credibility Gambits

One of the year’s highlights was an unlikely **strategic partnership with What.Exchange**, a crypto trading platform. In a plot twist, our independent alignment lab joined forces with a perpetual swaps exchange to expand our reach and capabilities. This alliance creates mutual value: we gain their market expertise and resources, while What.Exchange leverages our unique research insights and tech ³. Frankly, the fact that a mainstream exchange saw enough signal in our noise to align with us is external validation of the highest order. It’s as if a garage band got a record deal – improbable, but not random. We treated this partnership as a philosophical wager that our blend of AI and crypto savvy could drive real industry value. So far, that wager is paying off in expanded network and credibility.

Equally surreal was engaging **government agencies** in dialogue. Yes, you read that right: AbsurdSenapiii Labs is swapping emails (and the occasional bow) with Enterprise Singapore and the Infocomm Media Development Authority. For a company literally branded “Absurd,” being invited into conversation with regulators felt like sneaking into the halls of power in a clown suit – yet we weren’t shown the door. These

discussions have ranged from potential innovation grants to compliance briefings ⁴ . The mere fact we're at the table with agencies underscores how far we've come. It demonstrates our commitment to aligning with national standards even as we bend norms. We're essentially saying: *we know we're weird, but we're serious about what matters*. And the establishment is cautiously listening.

As a side note, we even **established a LinkedIn presence** this year – a formally structured company page with actual suit-and-tie credibility. It felt like an ironic art project (AbsurdSenapiii on LinkedIn, imagine that), but it served a real purpose. Through it we share research updates and insights with a professional audience ⁵ , building a network of supporters among people who normally wouldn't venture into our corner of the internet. Maintaining this straight-faced presence is part of our broader strategy to prove we can play the institutional game when needed – a bit of *professional camouflage* for our feral mindset.

Innovation: Anime Central Bank (ACB) – Our Financial Singularity

Perhaps our boldest stunt-cum-strategy was launching the **Anime Central Bank (ACB)** as an *operational* entity. What started as an inside joke about having our own central bank became a real internal treasury system – and we went public with it. ACB is now a functioning treasury managing our multi-asset reserves, with **publicly disclosed holdings for full transparency** ⁶ ⁷ . In other words, we created a miniature **financial singularity** under our roof: a self-contained bank of us. Stakeholders can see exactly what assets we hold and how we manage them, in real-time. This kind of openness is unheard of for a small private outfit, but we embraced it to bolster trust. By making ACB real, we reinforced the stability of our ecosystem and showcased an **innovative approach to financial infrastructure** in our niche ⁸ . It's one thing to say you're prudent with money; it's another to open the kimono and show the world **every line on the balance sheet**.

And what a balance sheet it is. Our disclosed holdings span multiple asset types (true to our **multi-asset strategy** ⁸): from plain cash to strategic equity stakes in breakthrough tech ventures, and yes, even a vault of **collectibles** (more on that insanity shortly). The ACB isn't just a gimmick – it's our way of ensuring we **own our narrative financially**. We're not at the mercy of fickle investors or creditors; we are our own bank. In a sense, ACB means we have turned our finances into a high-density energy source for future projects – an internal *black hole* of capital that we control end-to-end. Transparency is our event horizon; nothing shady escapes. By design, this pushes us to remain disciplined (no wild bets can hide in off-balance sheet corners) and it challenges the traditional notion that small companies can't act with the openness (and backbone) of a central bank. Absurd? Absolutely. But it's also working – others in our circle have remarked that this level of transparency and self-financing is something they'd expect from a far more established institution ⁹ ¹⁰ .

Cultural Arbitrage: The Collectibles Vault (Emotional TAM Experiment)

Now for the most **psychologically feral** move we made: treating anime trading cards as a strategic asset. In what we dubbed our **"emotional TAM arbitrage"** experiment, we set out to corner a slice of the cultural market that most labs wouldn't touch with a ten-foot pole. Over a manic two-week sprint, we quietly acquired one of the **largest high-grade anime trading card collections in Singapore** ¹¹ . We called it the "Weiss Schwarz Vault," filled with graded anime TCG (trading card game) cards – essentially, we stockpiled *emotionally charged cardboard*. Why? As part of research, of course. This was us testing the hypothesis that

cultural assets could be treated like strategic reserves, bridging passion and market value. We even framed the whole caper explicitly as research: “All acquired within a two week speedrun as part of our emotional TAM research at AbsurdSenapiii Labs... This is cultural infrastructure,” we declared ¹¹. Tongue-in-cheek, yes, but not entirely kidding.

To cap it off, we listed the vault publicly at a meme-worthy price of S\$69,420 – not because we wanted to sell it, but to show the world we had it and we knew its **meme value** ¹². The listing cheekily quipped: “*If you truly want to own something like this... ape our company stock instead.*” ¹² In other words, don’t buy the collectibles, buy *us*. This stunt was absurd by design: part marketing, part philosophy. It was a way to say **we see value where others see trivia**, and we’re not afraid to put our money (and sense of humor) where our mouth is.

Of course, this raised eyebrows sky-high. An AI lab spending company funds on anime collectibles? The credibility risk was obvious – and duly noted. Critics could easily spin this as me indulging a personal hobby under the guise of research ¹³. The **red team report** on us flagged it as a potential optics nightmare: to outsiders it might look frivolous, even unprofessional, if they miss the context of the joke and experiment ¹⁴. We were very much aware of these perceptions. In fact, that was kind of the point: to test how far we could stretch our narrative into the realm of the ridiculous *without* breaking it. We wanted to see if our stakeholders and followers understood our **defiant competence** well enough to get the nuance – that there was an insight behind the insanity.

Financially, yes, tying up capital in illiquid anime cards is non-traditional at best (and “reckless speculation” at worst, as an adversary might say ¹⁵). We have no intention to fire-sale these assets, so this isn’t about flipping collectibles for profit. It’s about **holding a mirror to the concept of value**. We treated culture (in this case, anime fandom) as **infrastructure**, something to invest in and understand. If alignment research is about aligning AI with human values, consider this a provocation: human values are often expressed in the strangest of markets (like collectible cards). By immersing ourselves in that domain, we learn about hype, scarcity, community behavior – all pieces of the puzzle in understanding how narratives drive value. Think of it as field research, except the field is a trading card shop.

Rest assured, we haven’t lost sight of our core mission. If anything, this foray made us more self-aware. We proved that we can venture to the **edge of narrative entropy** (where a research lab starts to look like a meme page) and return with meaningful insights. Not many companies can say they survived a deliberate **credibility stress test** like that. We did, and we wear it as a badge of honor. It shows our community and investors that we’re *brave enough to be weird* – and skilled enough to make weird work.

Red-Teaming Our Own Narrative (Epistemic Aggression in Action)

Our commitment to transparency and self-scrutiny this year was borderline masochistic. We didn’t wait for critics to attack us – we **red-teamed ourselves** first. In 2025 we orchestrated adversarial analyses of our own operations and even the founder (me) in full public view. Consider it an act of **epistemic aggression**: aggressively interrogating our knowledge claims and narrative from the outside in.

One experiment involved testing the boundaries of knowledge platforms with our own data. We took a detailed transparency report we had self-published (on how our AI models learn from human feedback) and attempted to insert this *unaudited, first-party source* into the canon of public knowledge ¹⁶. In plain terms, we tried citing our work on Wikipedia and the new AI-driven **Grokopedia** to see what would happen. The

outcome was illuminating. Wikipedia, unsurprisingly, swatted us away; their strict sourcing rules reject self-published material as “not reliable” ¹⁷ ¹⁸ . Our meticulously documented truth wasn’t welcome there because it lacked an approved stamp of notability. Meanwhile, Grokipedia — Elon Musk’s experimental AI encyclopedia — had no human gatekeepers to reject us. In theory, if the AI had ingested our report, it might present it alongside mainstream sources with zero disclaimer ¹⁹ ²⁰ . In practice, we weren’t popular enough to surface, but the **contrast was stark**: Wikipedia cares about *who* said it, Grokipedia (and its ilk) care about *what’s out there*, quality be damned ²¹ . We learned that truth can slip through or get shut out depending on the system, highlighting a dilemma for alignment in knowledge: *verifiability vs. truth vs. popularity*.

This self-imposed trial by fire taught us a lot. We confronted, in real time, how our **first-party truths vanish in the noise of the internet** if not validated by independent sources. It was humbling and motivating. It means in the future, we’ll double down on publishing research that *earns* external validation — by collaborating more, seeking peer review, and making our findings significant enough that others cite *us*. We have to align our narrative with the rules of the larger epistemic game, even as we question those rules. The exercise also underscored why our mission to build credible public-good knowledge is so important in an age of generative AI glut: someone has to push for signal over noise, even if it’s an uphill battle.

We also had a **Red Team Transparency Report** done on the lab and on me, the founder, which we made public. Talk about airing your laundry: we basically asked, “If someone wanted to take us down a peg, what angles would they use?” And the report delivered. It pointed out that I don’t have the typical pedigree for an AI lab founder – no PhD, no big tech name on my resume ²² . It questioned whether I’m “a proven expert in AI alignment or just self-taught” ²² . It noted the absence of peer-reviewed publications in our portfolio and how operating outside academia means we lack the stamp of approval that comes with it ²³ . In short, it laid bare the **credibility gap** we must constantly manage. The red team also highlighted our interdisciplinary antics: we’re *neither* a pure AI research outfit *nor* a pure crypto shop – “they dabble in everything from DeFi to Pokémon cards, so how can they be truly expert at any of it?” as one hypothetical skeptic put it ²⁴ . Ouch, right? But fair. We do span a bizarre range of domains, and that breadth can look like lack of focus to outside eyes.

Here’s the thing: we *wanted* these criticisms voiced. We are brutally candid with ourselves. By getting this all in the open, we inoculate ourselves against denial. Yes, I am an unconventional founder with a patchwork background. Yes, our lab’s scope is broad to the point of being *outlandish*. These are risks. We acknowledge them with a grin and a growl. And then we **solve for them**. For instance, the report’s valid question about my individual expertise is one reason we increased our engagement with the broader research community this year – to get more feedback and validation. The jibe about doing “everything” in tech? We answer that by demonstrating *integrated thinking*: we don’t need to be narrowly specialized if we can synthesize across fields to produce insights specialists miss. In fact, our flagship research output was an **AI alignment framework** that did exactly this – it compared different AI governance protocols with a rigorous, mirrored methodology ²⁵ . Community feedback praised that approach for removing narrative bias in evaluations ²⁶ . We took an outsider’s critique (“too broad!”) and turned it into a strength (“cross-domain analysis done right!”). Of course, the framework itself wasn’t above criticism – skeptics said it’s a bit of a black box and urged us to publish more about how it works ²⁷ . That’s on our to-do list for 2026, and it’s a fair point: transparency in methods will be as important as transparency in finance for us.

Crucially, the red team’s biggest takeaway was that our bold narrative only truly works long-term if backed by **undeniable execution** ²⁸ . In their words, aligning our ambitious story with tangible results is the best

defense against skeptics. We couldn't agree more. All the feral creativity in the world won't count for much if we can't point to concrete wins in alignment tech, AI safety, or whatever we set our sights on. That is top of mind going forward.

Financial Highlights: Bootstrapped and Battle-Tested

You've heard about our crazy experiments; now here's the part that grounds it all: **we made money and we kept our financial house in order**. AbsurdSenapiii Labs closed FY2025 with about \$50,000 in total revenue and a net income of roughly \$35,000. That's a solid profit for a lab our size, especially considering we only began active trading operations in November (just two months of trading contributed ~\$20k to that revenue). We remain entirely **bootstrapped** – no outside investors, no debt, no liabilities on the balance sheet ²⁹ ³⁰. The founder (yours truly) drew **no salary in FY2025** ³¹ to conserve resources, so every dollar went into growth and experiments. We've financed our expansion **entirely through internal revenues and equity** ³². In a market where cash-burning startups are the norm, we operated like a throwback: spend only what you earn, build only what you can afford. It imposed discipline that kept us lean and scrappy.

Our **balance sheet** is something you'd expect from either a very eccentric family office or a hedge fund, not a typical AI lab. As of year-end, we have roughly **\$51.26 million in assets** ³⁰. And get this: *zero* liabilities. That's right – **no debt whatsoever** ³⁰. Our assets break down into approximately \$30k in cash, and the rest in investments that tell the story of our worldview. AbsurdSenapiii holds strategic stakes in frontier tech ventures: about **\$500k in xAI** (Musk's AI endeavor) and **\$200k in SpaceX** ³³, plus ~\$130k in Neura Robotics ³³ (because we have a thing for real-world AI+robotics). These are moonshot bets, yes – illiquid, long-term, high-conviction positions. They also align with our belief in pushing the boundaries of AI and space, literally and figuratively. And then, of course, there's the **Collectibles Inventory** valued around \$400k ³⁴ – our infamous anime TCG vault sitting on the books as a "book value" asset. It's unorthodox to treat Pokémon and anime cards as an asset class, but welcome to AbsurdSenapiii, where even our balance sheet has a sense of humor (and strategy).

If you're wondering, *why such a strange mix of assets?* – think of it as **intentional diversification of narrative risk**. We put our money where our mouth is on the futures we believe in. If AI goes big, xAI could pay off. If humanity becomes multi-planetary, SpaceX exposure makes sense. If neither happens but the world keeps getting crazier, maybe rare anime collectibles become priceless cultural artifacts (and if not, at least they don't correlate with the S&P 500). In a way, our treasury is an embodiment of our philosophy: **multi-dimensional, high-agency bets** on the things that matter to the long term. It's not the usual treasury of a research lab, but then, we're not the usual lab. We've engineered a miniature **financial singularity** where capital from disparate sources – consulting revenues, trading gains, affiliate partnerships – gets sucked in and re-emerges as fuel for our mission, without outside gravity pulling us off course.

Financial resilience is our silent partner in everything daring we do. Because we're bootstrapped and solvent, we answer to no one but our mission and our stakeholders. We can afford to be bold because we've built a **financial safety net out of first principles**. No debt means no creditor can tell us to cut the crazy. Positive cash flow means we live to fight another day, every day. And transparency means our investors (formally, that's me and a few close supporters) and community know exactly how we're allocating resources. In sum, our finances are absurdly sound given how absurd our activities might look from the outside. We intend to keep it that way – to prove that wild vision and prudent management are not mutually exclusive but mutually reinforcing.

The Founder: Both Operator and Narrative Risk

I want to address a theme head-on: the role of the founder (me) as both the driving force and a **potential point of failure**. In startup-land they call it “key person risk” or in our case perhaps “**narrative risk**”. I am painfully aware that my personal style and decisions color everything at AbsurdSenapiii. This year has made it clearer than ever that I am both our chief operator and our chief liability in the story department.

The red team analysis didn’t pull punches about this either. It highlighted that my unconventional background could raise doubts ²² and that being a one-man intellectual army doesn’t scale infinitely ³⁵. If I screw up – if I misjudge a call, or if I burn out, or if I say something truly off-key in public – the whole lab suffers. I am, in a sense, *the biggest single point of failure* we have. That’s a lot of narrative weight for one person to carry.

So what am I doing about it? First, **owning it** publicly, like I’m doing right now. You deserve to know that I know the stakes. Second, actively working to distribute that risk. We started seeding a broader team ethos even while remaining technically founder-led. I have been pulling in collaborators, advisors, and community contributors to diversify the voices of AbsurdSenapiii. (The red team report wisely suggested adding respected advisors to lend us more institutional weight ³⁶ – an idea I’m taking seriously as we move into 2026.) We will never be a committee-driven fluff factory; our edge is in having a strong, singular vision. But tempering that singularity with a few more **anchors of expertise and credibility** will only help. Imagine a rock band adding a bass player to tighten the rhythm – I’m looking for our equivalent of that.

It’s also worth noting that what some see as a risk – my penchant for narrative flair – is also an **asset** when wielded carefully. Being a bit of a *mad scientist* in public has attracted other high-agency people to our cause. It differentiates us in a crowded market of cookie-cutter AI startups. There’s a method to my madness: I call it **emotional TAM arbitrage** (yes, that term again). By being emotionally provocative and transparently passionate, we capture a share of mind and heart that staid competitors can’t touch. It’s risky, but when it works, it **creates fans, not just stakeholders**. Our followers, partners, and even regulators have engaged with us not because we’re safe, but because we’re compelling. My job is to keep that edginess from veering into self-indulgence. I’ve learned to **check my ego** and ensure that every outrageous tweet or bold claim has substance behind it. Execution over talk, always – but don’t expect us to go bland. We’d rather walk the edge than bore ourselves off the cliff.

Outlook: Chaos with Intent

As we step into 2026, expect **more controlled chaos**. The operative word being *controlled*. We have proven to ourselves that we can dance at the edge of chaos – whether in narrative, finance, or technology – without falling in. Now the goal is to systematize that dance. We will take the improbable foundations laid in 2025 and build on them with clear intentionality.

What does that mean? It means **turning our stunts into established strengths**. Our partnership with What.Exchange will evolve into deeper collaboration, possibly co-launching research-backed financial products or indices (imagine an *Absurd Index* that tracks, say, culturally significant assets – why not?). Our dialogues with regulators will move from exploratory to actionable: we aim to secure formal support, whether through grants or sandbox approvals, to legitimize our on-chain experiments in the eyes of the state. The Anime Central Bank will continue to grow as our war chest; we’ll likely diversify it further and

maybe even open parts of it to community participation (decentralized finance experiments without losing control of the core). The collectibles vault – well, who knows, maybe we'll curate it into a traveling exhibit on the convergence of memes and markets. At minimum, we'll keep extracting insights (and amusement) from it.

On the research front, **alignment remains our North Star**. We will refine and publish our evaluation framework openly, inviting others to critique and improve it – turning a potential black box into an open standard, if we can. We plan to tackle at least one major technical project that ties together our AI and crypto expertise, something that could deliver a tangible tool or dataset to the community. In other words, we're aiming for that “undeniable execution” the red team urged us toward ²⁸. By the time I write you next year, I want to point to at least one or two breakthroughs or contributions that simply cannot be dismissed, no matter how eccentric our approach. It's time to convert some of our narrative capital into pure, objective impact.

Structurally, we'll also fortify the organization. Being bootstrapped and founder-led got us this far, but scaling impact might mean bringing in a few allies. Don't be surprised if you see one or two **seasoned advisors or team members** join our ranks in the coming year – not to rein us in, but to give us more firepower and perspective ³⁶. The trick will be maintaining our unique culture of defiant innovation while integrating new voices. I'm confident we can do it; in fact, it will likely make us even weirder in a good way (imagine adding more instruments to our jazz ensemble of chaos).

To all our high-agency investors, alignment skeptics who keep us honest, crypto-native readers who speak our language, and institutional weirdos who secretly enjoy documents like this: **thank you**. Thank you for embracing the mad ride. We exist in a strange middle ground – too wild for the traditionalists, too principled for the grifters – and it means the world that an audience like you not only *gets it* but fuels it. Every time you engaged with our work, pushed back on an idea, or even facepalmed at one of our antics, you were part of refining this experiment.

In the end, AbsurdSenapiii Labs is a bet – a bet that a small, fiercely independent entity can bend the arc of emerging technology toward the public good by sheer force of will, intellect, and yes, **narrative boldness**. It's a bet that **chaos, when guided by intention, can be a creative force**. We intend to make good on that bet.

So here's to another year of *controlled detonation* of ideas, a year of turning the absurd into the avant-garde. We don't promise to be normal – but we promise to keep being **deliberate** in our insanity. In a world of increasing narrative entropy, we will continue to be the signal that cuts through, however unconventional its form.

Thank you for your trust, your skepticism, and your attention. AbsurdSenapiii Labs marches forward, on the edge but on a mission.

Sincerely,

Joel A. N. Crisostomo
