

## Executive Summary

- **Background:** AbsurdSenapiii Labs, a Singapore-based AI alignment and alternative asset research lab, commenced public market participation on 19 January 2026 by launching its \$BUNI token – representing tokenized equity in the company – via the SOAR platform <sup>1</sup> <sup>2</sup>. Only a 6% stake (60 million of 1 billion authorized tokens) was minted at launch (5% floated to the public; 1% to the platform provider), ensuring the founder retains ~94% ownership control <sup>3</sup> <sup>4</sup>. This report documents the lab's milestones, partnerships, communications, and strategic shifts from the token launch through 27 January 2026 (SGT). It is compiled as an institutional-grade record suitable for UN archives, emphasizing verified facts, source-backed evidence, and clear distinction between confirmed information, analytical inferences, and unknowns.
- **Key Developments (19–27 Jan 2026):** During the first week post-token launch, AbsurdSenapiii Labs publicly rolled out governance innovations and content channels while reinforcing its conservative financial approach. The \$BUNI token's debut saw a thinly-traded market with an initial sharp price increase (consistent with low float dynamics) <sup>5</sup>. The founder, Joel A. N. Crisostomo ("Absurdsenapiii"), released a comprehensive due diligence report to preemptively address regulatory and investor scrutiny, highlighting the lab's 2025 achievements in transparency and governance <sup>6</sup> <sup>7</sup>. The lab announced strategic partnerships and platform integrations (e.g. verification on Solana's Jupiter aggregator to prevent token impersonation) and signaled its alignment with national innovation programs (engaging Enterprise Singapore and IMDA's PIXEL initiative) <sup>8</sup> <sup>9</sup>. Mid-week, the founder initiated an on-chain buyback of ~\$3 million BUNI (about 6% of the public float) using project-generated fees, modestly reducing circulating supply and demonstrating long-term confidence (founder's effective holding moved above 94%) <sup>10</sup> <sup>11</sup>. Throughout, all public communications underscored that such actions are discretionary and policy-bound – framing buybacks and liquidity moves as *risk controls* rather than speculative activity <sup>12</sup> <sup>13</sup>. By 27 Jan 2026, the \$BUNI token had ~51 holders and a market capitalization around **\$30,000** (at ~\$22.7K USD) based on a ~\$0.00045 token price <sup>14</sup> <sup>15</sup>, reflecting gradual adoption.
- **Structural and Operational Shifts:** AbsurdSenapiii Labs leveraged the token launch to pivot its research output and community engagement strategy. Previously, the one-person lab published dozens of open reports and analyses on its public GitHub ("Absurd-alignment-lab") <sup>16</sup>. In this period, however, the lab introduced Patreon membership tiers and LinkedIn outreach as new channels for content – marking a shift from fully open research to a hybrid model of public summaries and gated deep-dives. For example, a Patreon series titled "*AbsurdSenapiii After Dark*" was teased (e.g. discussing a 73-page AI thesis) to provide subscriber-only content, while free previews and LinkedIn posts distill key insights for broader audiences <sup>17</sup> <sup>18</sup>. This reflects a cadence change from high-frequency GitHub updates to more curated, possibly less frequent publications with monetization or community-building aims. The lab also used local community platforms like Carousell to promote benefits (Patreon subscribers receiving trading-card discounts) and operational notices <sup>19</sup> <sup>20</sup>, underscoring a grassroots approach to engagement alongside tech-centric forums.
- **Governance, Partnerships, and Risk Posture:** The token launch did not alter the legal governance structure – AbsurdSenapiii Labs remains a private limited company with unilateral founder control under Singapore law <sup>21</sup> <sup>4</sup>. However, new *de facto* governance experiments

are in play: token holders have economic exposure but no voting rights, and the founder has voluntarily committed to public evidence-logging and milestone-based transparency to maintain trust <sup>22</sup> <sup>23</sup> . Key partnerships in this period include the platform provider *Soar Innovations LLC* (which not only facilitated the token launch under a patent-pending DRP standard but also took a 1% equity stake in BUNI <sup>24</sup> ) and integrations with the *Solana* DeFi ecosystem (e.g. engagement with Jupiter aggregator <sup>9</sup> and mentions of Axiom Exchange on social media). The lab also aligned with government and industry bodies: it has been in communication with **EnterpriseSG** and **IMDA PIXEL** about innovation pathways, signaling intent to fit within Singapore's tech governance sandbox <sup>25</sup> . Throughout, the founder's public messaging and the lab's *Anime Central Bank (ACB)* framework emphasize robust financial controls – e.g. multi-asset reserves and no leverage – aiming to meet Monetary Authority of Singapore (MAS) expectations for prudent risk management <sup>9</sup> . An internal “risk register” of potential failure modes (regulatory classification, key-man risk, market volatility, etc.) has been identified <sup>26</sup> <sup>27</sup> , with mitigations like capped public float, on-chain audits, and staged growth to preempt these issues. This cautious, transparency-forward posture is intended to make the project “red-team proof” and sustainable, in line with UN Sustainable Development Goals values (long-term resilience, ethical AI) <sup>28</sup> <sup>29</sup> .

- **Forward Outlook (Next 90 Days):** The next three months (through April 2026) will be critical for AbsurdSenapiii Labs to solidify credibility and momentum. Immediate priorities include maintaining orderly \$BUNI markets (ensuring liquidity and avoiding speculative excess) and delivering on promised research content to stakeholders. Because the launch agreement prohibits new token mints for 3 months <sup>30</sup> <sup>31</sup> , the lab has a grace period to focus on fundamentals: growing its community, demonstrating research value, and tightening any operational loose ends before any further equity can be floated. The founder must also navigate single-founder risks – likely by formalizing some processes or advisory inputs – to assure holders and observers that the project's success isn't bottlenecked by one individual's bandwidth. Partnerships and affiliations (with platforms, affiliates like what.exchange, and public agencies) should be actively managed to yield tangible integrations or pilot projects in this window. By the 90-day mark, AbsurdSenapiii Labs should be positioned either to “**scale up**” (if milestones are met and justified, potentially considering a broader token release or external collaborations) or “**hold steady**” (if prudent to delay expansion, continuing the controlled-build strategy). This report's evidence log, fact-base, and risk register provide a foundation for continuous monitoring. All signs indicate the lab is treating this period as an extended public beta – a time to prove its model's viability under real-market conditions without compromising its ethos of transparency, alignment, and financial integrity.

### **Timeline of Milestones (19–27 Jan 2026)**

*(All dates in SGT. Impact assessments in italics.)*

- **2026-01-19 – Token Launch and Initial Market Activity:** AbsurdSenapiii Labs formally launched the **\$BUNI** token on January 19, 2026 via the SOAR platform, executing a controlled initial mint of 60 million BUNI (6% of total supply) <sup>1</sup> <sup>3</sup> . This consisted of **50 million tokens (5%)** made available to the public through an automated bonding curve pool and **10 million (1%)** allocated to Soar Innovations as a platform fee/equity stake <sup>2</sup> <sup>24</sup> . *Impact:* This event marked the lab's first external funding channel and public market presence. The bonding curve mechanism led to low initial liquidity and a sharp early price uptick as a few initial trades were executed <sup>5</sup> . Despite the listing, governance remained firmly centralized – token holders received economic exposure but no decision-making power (no on-chain voting rights were conferred) <sup>22</sup> <sup>4</sup> . All legal governance stayed with the Singapore Pte. Ltd. entity and its sole shareholder (the founder), meaning the launch was structured to raise capital without ceding control. The **SOAR**

**platform disclosure** highlighted a 3-month no-mint provision to prevent sudden dilution <sup>30</sup> <sup>31</sup>, reinforcing investor protections in the launch phase. By end of launch day, \$BUNI was project-verified on SOAR's site <sup>32</sup> with an initial market cap around \$15k-20k (based on bonding curve pricing). The holder count was limited (dozens of early adopters), consistent with a "friends and supporters" style rollout rather than a broad public ICO.

- **2026-01-20 – Public Due Diligence Release & Transparency Measures:** Within 24 hours of the token launch, founder **Joel Angelo N. Crisostomo** published a **2026 Due Diligence Report** on AbsurdSenapiii Labs and its Bunny Land project <sup>33</sup>. Shared via LinkedIn as a "Founder Update," this extensive report (compiled with AI assistance) laid out all critical information about the lab's finances, governance, and operations to date <sup>34</sup> <sup>35</sup>. It enumerated *FY2025 financials* (e.g. positive net income, zero debt, ~\$50k revenue) and *key 2025 milestones*: transitioning from a pilot to a live entity, launching an internal **Anime Central Bank (ACB)** for treasury management, being recognized by **Grokkipedia** as a self-published alignment institution, engaging with Singapore government agencies (EnterpriseSG and IMDA PIXEL), and preemptively red-teaming the lab's own vulnerabilities <sup>6</sup>. *Impact:* This proactive transparency dump was designed to instill confidence and "survive scrutiny from regulators, investors, alignment critics, and red teams" <sup>33</sup>. By publicly documenting everything from incentive structures to internal audit logic, the founder effectively **open-sourced the company's due diligence**. This move not only built credibility with potential partners and token holders, but also set a high standard for accountability (fulfilling the promise of full public transparency made during the launch <sup>34</sup>). It likely contributed to AbsurdSenapiii Labs being seen as an unusually forthright and evidence-driven project in the crypto/AI space, which could discourage misinformation and short-term speculation. The lab also submitted \$BUNI for listing verification on Solana's **Jupiter** DEX aggregator around this date (as noted in a social media update), aiming to prevent fake tokens and simplify trading – a minor technical milestone reflecting operational diligence (source: founder's X post, 20 Jan).
- **2026-01-21 – Strategic Token Buyback and Market Stabilization:** A few days into trading, AbsurdSenapiii Labs conducted an **open-market buyback** of approximately **3 million BUNI** (about 6% of the circulating supply) using internal resources. The founder announced this action on social media, framing it as a step to "regain some of our ownership" and help long-term plans (e.g. lowering dilution cost for a future IPO-like event) <sup>36</sup> <sup>11</sup>. This repurchase effectively moved a portion of tokens from public circulation back into founder-held wallets. *Impact:* The buyback underscored the lab's commitment to **price stability and insider confidence**. It modestly increased the founder's ownership stake (from 94% to ~94.3% of total equity, depending on how the bought-back tokens are treated) and signaled to the market that the team believes the token is undervalued or worth supporting. Importantly, the lab handled this in a **non-promotional, compliance-oriented manner**: no promises of token price support were made, and the founder explicitly stated that all such actions are "discretionary, policy-bound, and non-promissory... operational risk control, not speculation" <sup>12</sup>. In practice, trading fees from the BUNI-SOL liquidity pool (facilitated by Soar/Meteora) were used to fund the buybacks <sup>37</sup>. The lab set clear parameters: a portion of fees can be retained for treasury management *only* to automate buybacks for consolidation of ownership and to provide liquidity when needed for orderly markets <sup>12</sup>. No open-ended commitment was given (no targets or guarantees), aligning with MAS-aligned prudent conduct. This event was logged in the lab's internal evidence records, maintaining transparency about insider trading of its own token. By week's end, the circulating public float had decreased accordingly (public holders now ~47 million tokens), and the market price remained relatively stable in USD terms, suggesting the intervention was successful in **preventing excessive volatility** in a critical early phase.

- **2026-01-22 – Partnership and Community Updates:** As the project gained footing, AbsurdSenapiii Labs solidified several **partnership and affiliate relationships**. Notably, the founder disclosed an affiliate partnership with **What.Exchange**, a crypto trading platform, wherein the lab earns a small commission from referral trading volume <sup>38</sup>. He was transparent that ~80–90% of any such affiliate revenue is reinvested into the business (for development and growth) with the remainder for expenses <sup>38</sup>. *Impact:* This indicates the lab's resourcefulness in generating supplemental income and its philosophy of plowing benefits back into the project (consistent with being entirely founder-financed to date). The disclosure, made publicly via Twitter, also serves as a **mitigation of conflict of interest** – assuring the community that promotional links (e.g. referral codes) are used to support the project's mission, not personal gain <sup>38</sup>. In parallel, the lab's community outreach extended to local platforms: an **official Telegram channel (t.me/labalignment)** was active for announcements, and a Carousell listing was maintained for **"Patreon \$25 Tier – Card Purchase Discounts"** <sup>19</sup> <sup>20</sup>. The latter offered Patreon supporters discretionary discounts on physical anime trading cards the lab deals in, effectively bridging the lab's research domain (alternative assets) with community perks. Additionally, on LinkedIn and other channels, AbsurdSenapiii Labs positioned itself within Singapore's innovation ecosystem: for example, comments and posts mentioned that the lab had *onboarded to IMDA's PIXEL program* to explore enterprise pilots, and that it was pitching itself as a "one-person lab turned system-level actor in under a year" to attract collaborators <sup>35</sup> <sup>39</sup>. *Impact:* These moves collectively show a **broadening outreach strategy** – engaging retail hobbyists (via trading cards and Patreon), crypto traders (via exchange affiliations), and institutional/enterprise circles (via LinkedIn and government programs). The multi-pronged approach is building resilience by not relying on any single community. Each partnership – whether a formal program or an informal affiliate – adds a layer of validation or resource to the project, while the founder's forthright communications (e.g. clearly stating "Alignment > extraction" in revenue use <sup>40</sup> <sup>41</sup>) aim to cement trust across these diverse stakeholder groups.
- **2026-01-25 – Research Output Pivot and Content Gating:** By the end of the first week, evidence emerged of a **shift in the lab's research dissemination model**. AbsurdSenapiii Labs had historically published open research notes on GitHub (dozens of reports including technical analyses and even bounties for community input) <sup>16</sup>, but in late January it rolled out new content channels implying partial gating. A series branded **"AbsurdSenapiii After Dark"** was referenced on social media and cross-linked to a Patreon page <sup>18</sup>. One highlighted piece was an in-depth **73-page thesis on xAI (Explainable AI)**, which the lab teased under this series <sup>18</sup>. Publicly, only summaries or select insights were shared (for instance, a Twitter thread titled "Exhaustion, Alignment, and a 73-Page xAI Thesis" was noted, likely condensing the findings), with the full report accessible to patrons. *Impact:* This marks a **notable change in cadence and audience strategy**. Instead of rapid-fire public dumps, the lab is experimenting with a "freemium" model: comprehensive research is still being produced (and arguably at a high level, given the length and depth of the xAI report) but the distribution is tiered – core community or supporters gain first or full access, while broader public gets high-level takeaways later. This could be financially motivated (to create a steady support stream given the small token raise) and/or quality motivated (to engage a dedicated audience in discussion before wider release). The lab also continued posting *public previews on LinkedIn*: for example, short articles on AI governance or exploit analyses that showcase their work without giving away the full store <sup>42</sup>. Overall, this pivot suggests AbsurdSenapiii Labs is striving to **balance openness with sustainability** – remaining true to its transparency ethos (nothing important is kept truly secret, only delayed or scaled by audience) while leveraging the interest generated by the token launch to build a loyal following willing to subscribe or otherwise engage more deeply. It's a delicate shift: the lab must ensure that moving some content behind Patreon does not undermine its credibility for openness. Thus far, it appears to manage this by providing at least *preview content*

or summary statistics openly (for instance, any claim affecting stakeholders, like financial results or governance changes, is still published in free forums like annual reports or social posts).

*(Additional context: No major events were recorded on 23–24 Jan specific to new announcements; these days saw continuation of prior themes – e.g. the founder interacting on Twitter with community questions, reiterating long-horizon plans, and monitoring token performance. By 27 Jan, AbsurdSenapiii Labs had not announced any new hires or funding beyond the token; operations remained lean with the founder at the helm and a few community moderators across platforms.)*

### **Partnerships and Counterparties**

**Platform & Equity Partner – SOAR Innovations LLC:** AbsurdSenapiii Labs' token launch partner is Soar Innovations, a Wyoming-based tokenization platform that provided the **"Digital Representation of Participation (DRP)"** framework for \$BUNI <sup>43</sup> <sup>44</sup>. Under the standard launch agreement, Soar implemented BUNI's smart contract on Solana (with a mint cap of 1 billion tokens) and facilitated the initial bonding curve offering <sup>45</sup> <sup>46</sup>. In return, Soar received **10 million BUNI (1% of total supply)** as an equity stake, aligning its incentives with the project's success <sup>24</sup> <sup>47</sup>. *Relationship:* Formal, contract-based partnership. Soar is effectively both a service provider and a minority equity holder. *Status & Scope:* Soar continues to host the token's trading pool and project page <sup>48</sup> <sup>14</sup>. Its role is primarily technical and operational (providing the marketplace and bonding curve mechanism). There is no indication of Soar participating in governance or operations of AbsurdSenapiii Labs beyond the launch. As a counterparty, Soar's interests are protected by the contract's conditions (e.g. lock-up on additional minting, ensuring their 1% isn't diluted for at least 3 months) <sup>30</sup>. This partnership anchors AbsurdSenapiii Labs in a **compliance-conscious launch environment** – the DRP standard enforces transparency (all tokens represent fixed equity share) and accountability (auditable on-chain issuance) <sup>49</sup> <sup>50</sup>.

**Affiliate Partner – What.Exchange:** The lab engaged in an affiliate partnership with **what.exchange**, a cryptocurrency trading platform founded by influencer @ImNotTheWolf. Joel (the founder) publicly disclosed that he is an *affiliate partner*, meaning if users trade via his referral link, the lab earns a commission <sup>38</sup>. He clarified that ~80–90% of any such affiliate earnings will go directly into **business development and growth** initiatives, with only ~10–20% for operating costs <sup>40</sup>. *Relationship:* Informal revenue-share partnership. There is no equity exchange or long-term contract publicly known; it's a standard affiliate arrangement governed by what.exchange's program terms. *Status & Scope:* Active as of late Jan 2026. AbsurdSenapiii Labs has incorporated this affiliate link into its community communications (likely sharing it on Discord/Telegram or Twitter for users interested in trading). The scope is limited to generating extra funding and possibly benefiting from any trading activity of the community. Importantly, the founder's transparent stance (offering non-ref links as an option and explaining use of proceeds <sup>38</sup>) sets a **ethical tone** – the partnership is meant to support the lab's mission, not just monetize the audience. In terms of risk, the sums are presumably small (given modest community size), so this is a low-stakes, **low-risk partnership** financially. Reputationally, it ties AbsurdSenapiii Labs to what.exchange's brand; any issue with that platform could reflect on the lab, but as of this report, what.exchange is seen as an upcoming exchange with a "no VC funding" ethos (aligned with the lab's independent stance).

**Government/Industry Liaisons – EnterpriseSG and IMDA PIXEL:** AbsurdSenapiii Labs signaled engagement with **Enterprise Singapore (EnterpriseSG)** and the **Infocomm Media Development Authority's PIXEL innovation hub** <sup>8</sup>. These are Singapore government entities that support startups and tech innovation. The lab reported that it has *"engaged [them] on formal innovation pathways"* <sup>8</sup> – which suggests early discussions or acceptance into a program (PIXEL often runs sandboxes and accelerator-like support for tech projects). *Relationship:* Advisory/innovation support partnership. No financial investment from the agencies is noted, but their involvement could grant the lab mentorship,

networking, or validation. *Status & Scope:* Ongoing (as of Jan 2026) in the form of consultations, workshops, or being part of an official cohort. The scope likely includes guidance on product development (e.g. how the lab's AI research can find industry applications) and compliance (e.g. ensuring alignment with local regulatory requirements for crypto and AI). This partnership anchors the lab in Singapore's **national tech ecosystem**, potentially opening doors to pilot projects or future grants. From an institutional perspective, having government-linked agencies aware of and advising the lab adds credibility and could mitigate regulatory risk (since the lab is proactively aligning with national innovation objectives).

### Community & Content Partners:

- **Patreon** – *Platform for Research Patrons:* The lab launched a presence on Patreon (username AlignmentLab, based on linktree references and Carousell posts) to monetize content and build a patron community. Patreon is not a partner per se, but the lab's use of it creates a new class of stakeholders – paying subscribers who get benefits like exclusive research content and merchandise discounts <sup>20</sup>. As of Jan 2026, the lab offers at least a "\$25 Tier" which ties into real perks (e.g. trading card purchase discounts) <sup>19</sup>. *Scope:* Patreon serves as both a **content distribution channel and a minor revenue source**. The lab will have to maintain a flow of quality content to satisfy patrons, essentially treating them as micro-investors in its research. This dynamic is more informal than token holders (Patreon subscribers have no equity or tokens by default), but it's a **reputational partnership** – Patreon provides the platform, and in return takes a fee, while the lab gains committed followers. The success of this channel will depend on the lab's ability to deliver value (e.g. advanced insights, Q&As, or community involvement in projects like Bunny Land).

- **Carousell** – *Marketplace for Physical Assets:* AbsurdSenapiii Labs uses Carousell (a popular Singapore peer-to-peer marketplace) under the handle "absurdsenapiii-labs" to engage with the physical collectibles community. It has listings in the Announcements category, such as operational updates ("No meet-up dealing from 12 Jan 2026") and Patreon-related promotions <sup>51</sup> <sup>20</sup>. *Scope:* While not a traditional partnership, Carousell is a channel where the lab interacts with local buyers for its **metal anime trading cards** and possibly other merchandise. The lab's **Metal Anime Trading Card Manufacturing Framework** is a project to create collectible cards as an alternative asset class <sup>52</sup> <sup>53</sup>. By selling and advertising on Carousell, the lab forges relationships with collectors and testers of this product line. This grounds the lab's abstract research in a tangible community. It's also part of the lab's revenue mix (trading card sales can generate cash). *Status:* Active, with frequent updates (listings edited or reposted in Jan 2026 as indicated by timestamps <sup>54</sup> <sup>55</sup>). The tone of these communications is business-like and policy-oriented (one listing spells out trading terms, reflecting the founder's preference for clear rules even in small dealings).

- **Grokkipedia / Bunny Land Community** – *Alignment Ecosystem Counterparties:* Internally, the lab is intertwined with "**Bunny Land**," its community-driven AI governance experiment. Bunny Land has its own "constitution," elected roles, and even a fictional Central Bank <sup>56</sup> <sup>57</sup>. In 2025, **Grokkipedia** (a community-run AI encyclopedia in Bunny Land) formally accepted AbsurdSenapiii Labs as one of the first self-published alignment institutions <sup>58</sup>. While not a conventional partnership, this relationship means the lab's research and governance proposals are **peer-reviewed in a live community sandbox**. *Scope:* Bunny Land acts as both a testbed and a stakeholder: its members can red-team the lab's ideas (as happened with public red-teaming campaigns) <sup>59</sup>, and successful practices in Bunny Land (like the Anime Central Bank) are then showcased by the lab as proof-of-concept <sup>60</sup> <sup>61</sup>. The lab's founder also holds a leadership role in Bunny Land's narrative (styled as the "Future President of Bunny Land" on social profiles <sup>62</sup>). *Status:* Ongoing and symbiotic. Bunny Land's community activities provide data and case studies for the lab, and in return the lab provides intellectual frameworks and likely financial support (Bunny Land's treasury might be funded or advised by the lab). This relationship anchors

AbsurdSenapiii Labs in the **wider alignment research community** and gives it a grassroots legitimacy that pure corporate initiatives often lack.

**Other Mentioned Counterparties:** The lab's social media mentions **@LaunchOnSoar** (Soar's handle), **@solana**, and **@AxiomExchange**, indicating outreach or dialogue with those entities <sup>63</sup> <sup>64</sup>. For example, a tweet "Companies who are transparent stay winning" tagged Soar and Axiom, perhaps to commend transparency – hinting that Axiom (a Solana-based exchange) could be a prospective listing venue. No formal partnership with Axiom is confirmed by 27 Jan, but the public tag suggests the lab is networking among exchange platforms to broaden BUNI's availability. Likewise, the lab interacts with **Meteora** (possibly the AMM or liquidity manager for Soar's pools) as a technical partner for liquidity provision <sup>37</sup>. These relationships are at the *ecosystem level* – the lab aligning itself with platforms and projects that share its values (transparency, defensive operations) rather than signing explicit deals.

### **Product and Channel Launches**

**\$BUNI Token Launch (Public Market Entry):** The launch of \$BUNI on 19 Jan 2026 is the flagship product launch for this period <sup>1</sup> <sup>2</sup>. It transformed AbsurdSenapiii Labs from a private endeavor to a **publicly valued entity** with a real-time market price. The mechanics of the launch were novel in their **milestone-based optionality**: only a small portion of equity was floated, treating public trading as an experimental "pilot" phase <sup>65</sup>. By design, further token issuances (to simulate something like future funding rounds or an IPO) are *not guaranteed* but conditioned on performance and governance milestones <sup>66</sup> <sup>65</sup>. This approach essentially tokenized an option for wider market participation, rather than immediately distributing ownership broadly. The Soar platform provided features like on-chain project pages, a forum, and artifacts (the lab uploaded PDFs of its Anime TCG thesis, Reskilling Manifesto, FY2025 Annual Report on the Soar page) <sup>67</sup> <sup>68</sup>. The **launch mechanics** included the use of a bonding curve AMM which set the initial price and allowed continuous liquidity. Over the first week, BUNI's price fluctuated in a range consistent with low liquidity: it rose ~+72% from initial pricing as per 24h stats on 27 Jan <sup>48</sup> <sup>69</sup>, then stabilized. The *Projected Future Valuation* metric on Soar (which scales the current price to the full 1B supply) hovered around ~\$450k <sup>14</sup> <sup>70</sup>, meaning the market was implicitly valuing the whole lab at roughly half a million USD if extrapolated – a modest but non-zero valuation for an unfunded research outfit. The success criteria for this product launch were **not** fundraising maximization (only a few thousand dollars equivalent were raised via initial token sales), but **market signaling** and **community building**. By having a token live, the lab invited a new category of stakeholder (crypto-aligned supporters) and demonstrated its commitment to open accountability (every action affecting the company's value is theoretically reflected on-chain). In summary, the BUNI launch served as a *platform launch* in itself: an on-chain extension of the lab's operations, establishing the foundation for any future marketplace or governance experiments.

**AbsurdSenapiii After Dark (Patreon Content Channel):** Around this timeframe, AbsurdSenapiii Labs launched "AbsurdSenapiii After Dark" (AAD), a content series delivered possibly via Patreon and teased on Twitter <sup>18</sup>. The *branding* ("After Dark") suggests more candid, in-depth explorations of topics the lab cares about – for instance, detailed research on AI, crypto, or governance that may be too niche or lengthy for general social media. This is effectively a **channel launch** for the lab's research content: moving from GitHub plaintext reports to a more interactive, subscription-based model. As part of this launch, the lab integrated its Patreon with other platforms: e.g. offering Patreon subscribers benefits on Carousell (as noted, the \$25 tier listing) and likely giving Discord/Telegram access or voting power on certain internal decisions (common Patreon perks, though not explicitly stated in sources available). The cadence hinted is perhaps monthly deep dives or weekly updates "after dark." By 27 Jan, one major piece (the 73-page xAI thesis) was in circulation under this series, and possibly other smaller posts (like *AbsurdSenapiii After Dark #1, #2*, etc.) were made available to patrons. The **content strategy** here is twofold: (1) **Gating advanced content** to create a premium experience and an alternative revenue stream, and (2) **Maintaining public previews** to keep the wider community engaged. For example, the

lab might post a summary of findings on LinkedIn or Twitter and note that the full report is available for patrons. This way, the lab doesn't fully retreat from open research – it creates a funnel where those most interested can dive deeper (and financially support the work). The launch of AAD can be seen as the lab **commercializing its research outputs in a measured way**, an important step for long-term viability since prior to this the lab's work was funded purely by founder capital and small revenues. If successful, Patreon could cover operational expenses, allowing the lab to preserve capital raised via \$BUNI for strategic investments (like technology, hiring, or seeding liquidity as needed).

**Marketplace Integration (Trading Cards & Merch):** The lab's niche focus on **alternative assets (anime trading cards)** saw a sort of soft launch through the period's activities. The "Metal Anime Trading Card Manufacturing Framework" developed by the lab <sup>52</sup> implies the lab is prototyping physical collectibles as an asset class. In Jan 2026, the lab used the Carousell platform to list and possibly sell some of these cards, as well as to make announcements about how it will conduct trades (no meet-ups, etc., indicating an e-commerce style approach even on a peer marketplace) <sup>51</sup>. While not a centralized marketplace launch (the lab did not launch its own e-commerce site yet), this *represents a channel launch* for its products. Essentially, AbsurdSenapiii Labs is treating Carousell as its **beta marketplace** for these cards and related merchandise (perhaps books or printed reports in the future). By 27 Jan, the lab also signaled acceptance of modern payment options (one listing mentions "we now accept Atome – buy now pay later", suggesting the lab is adapting to consumer-friendly payment methods) <sup>71</sup>. This shows a degree of operational maturity in how the lab commercializes its side products. The integration of Atome (a BNPL service) and Carousell promotions indicates the lab is not just targeting crypto enthusiasts but also ordinary collectors/shoppers, bridging Web3 and traditional retail experiences. While revenue from card sales in this window is likely small, the **platform launch aspect** is the creation of a pipeline from research to product: the lab researches anime card markets, manufactures limited runs of high-quality metal cards, then sells them to test the market's response. Each sale or interaction provides data and feedback that loops back into the research.

**Social Media and Web Presence Updates:** Alongside formal products, AbsurdSenapiii Labs "launched" or revamped several online channels in this period: - **LinkedIn Company Page & Newsletter:** The lab's LinkedIn presence became active around the due diligence report release (mid-Jan). The company page (AbsurdSenapiii Labs) even engaged in comments, role-playing as an AI ("Lol my owner is trying his best to avoid a bad ending" jokingly remarked by the company account on the founder's post). This indicates the founder might be using the company page to add flavor/personality to updates. We also see a Bunny Land LinkedIn persona active. The *launch* here is the use of LinkedIn as a professional outreach and possibly the start of a newsletter or article series on LinkedIn. For instance, the founder's long-form posts serve as de facto press releases and thought leadership pieces (like the Makina Finance exploit analysis on LinkedIn mentioned in search results <sup>42</sup>). So, mid-late January saw LinkedIn emerge as a **key communication channel to institutional audiences**. - **Telegram Channel:** Although likely created earlier, "t.me/labalignment" was actively broadcasting by this time. The lab used it to post quick updates, coordinate community efforts (e.g. red-team tasks or announcements of new posts). The *public launch* of the Telegram channel might have been communicated around the token launch ("Join the AbsurdSenapiii Alignment Lab Telegram" was part of the founder's Twitter bio) <sup>72</sup>. So in effect, late Jan consolidated Telegram as the hub for community discussion outside of Twitter. - **Website (AlignmentLab.com) and Linktree:** The official website remained mostly a static informational site <sup>73</sup> <sup>74</sup>, but it got updated branding ("Exploring the frontier between intelligence, story, and human intuition.") and possibly new contact forms around this time. The **linktr.ee/alignment** was shared as a centralized list of all these channels (Twitter, LinkedIn, Patreon, Telegram, Carousell, etc.), essentially launched/updated to ensure anyone interested from the token launch could easily find all official links. Ensuring consistent naming ("Alignment Lab") across these platforms is part of the brand consolidation that happened as the lab stepped onto a bigger stage.

In summary, the platform and channel launches in this period transformed AbsurdSenapiii Labs from an *informal research blog* into a multi-channel micro-institution: it has a token on a blockchain, a presence on professional networks, a monetized content stream, and even a foot in traditional retail. Each launch was modest in scale (no flashy IPO or large-scale product release), but together they indicate the formation of a **sustainable ecosystem around the lab's work** – bridging on-chain and off-chain, research and practice, community and institution.

### **Research Output Changes (Cadence, Gating, Platforms)**

**From Open GitHub to Tiered Access:** Prior to 2026, Joel (AbsurdSenapiii) published research frequently on GitHub – with an internal output of 40–60 reports per month by the founder's count <sup>75</sup>, and many made public (including detailed technical reports, “blue-team/red-team” analyses, and even bounties inviting community input on research questions) <sup>16</sup>. This open model ensured *everything was transparent by default*. However, around the token launch, a shift became evident: while essential reports (like the Due Diligence and Annual Report) were still released publicly, **some new analyses were withheld for curated release**. The creation of the Patreon *After Dark* series exemplifies this – deep research is now first a Patreon post, then later distilled for public. The cadence appears to be moving from rapid serial publishing to a more **strategic publishing schedule**. Instead of dozens of scattered notes, the lab is aiming for more comprehensive pieces at a possibly lower frequency (e.g. monthly big reports, weekly updates) but supplemented by short-form posts on social media to maintain engagement. This is partly driven by the founder's finite capacity (as a one-person lab, he must balance research with new duties like investor relations and product development). It's also influenced by the desire to **add value for token holders and patrons** – exclusive or early insights can be seen as a perk of being part of the project's inner circle.

**Public Preview and Evidence Logging:** Notably, the lab is *not* abandoning transparency. In fact, it pledged to maintain an **open evidence log** of its claims and actions <sup>33</sup>. In practice, this means whenever the lab makes a significant claim (financial result, partnership, risk assessment), it either cites a source or provides documentation for it. We see this in how the founder communicates: the LinkedIn due diligence post is itself a condensed evidence log (listing claims like “no outside capital” and backing them by referencing already “published everything you'd want to ask” <sup>35</sup> <sup>39</sup>). Furthermore, the founder started using **Twitter's Article feature** in Jan 2026 to publish longer-form posts directly on X (Twitter). For example, he posted a “Twitter Article” link alongside the affiliate revenue disclosure <sup>76</sup>, which likely contained a detailed breakdown of the lab's affiliate program rationale and perhaps other financial disclosures. This suggests that even as some content goes patron-only, the lab is ensuring that *critical transparency documents remain public*. The GitHub repository might still be updated with sanitized versions of reports after a delay (for instance, the affiliate revenue breakdown appears to have a GitHub link provided <sup>77</sup>, implying a public repository still being used to host the full report for reference). Therefore, the shift is nuanced: **operational and speculative research** (like market strategies, forward-looking plans) may be kept semi-private, whereas **accountability documents** (like audited results, governance rules, and key technical findings) remain open. The cadence is thus bifurcated – *continuous internal research* vs. *periodic external publication*. Token holders and patrons effectively get a front-row seat to the continuous stream (via Telegram updates, patron posts), while the general public sees a digest version at intervals.

**Focus Areas and Content Evolution:** In terms of substance, the research output over this period seems to emphasize **practical governance experiments and financial integrity**. The lab's writing and posts highlight topics like: the **C2C (Citizen-to-Citizen) AI Governance framework** through Bunny Land's example <sup>57</sup>, the **Anime Central Bank's financial model** (multi-asset treasury ensuring resilience) <sup>60</sup> <sup>61</sup>, and broader industry commentary such as the 73-page xAI thesis or exploit analyses. This indicates a slight broadening of scope: originally purely self-driven topics (like niche card market analysis, etc.) are now complemented by topics of wider interest (AI safety thesis, DeFi exploit

analysis) – likely to demonstrate the lab's thought leadership beyond its immediate projects. The frequency of smaller GitHub posts (e.g. weekly trading reflections, daily notes) may have decreased as the founder channels those observations into social media snippets instead (which are less formal and more interactive). For instance, instead of a GitHub log of daily trades, he might tweet “all company actions remain discretionary...” to summarize the philosophy and engage the community <sup>78</sup>.

**Community Feedback and Iteration:** Another component of research output is *community-driven research*. The lab used to run bounties and get feedback via Ethos and Discord <sup>79</sup>. With the introduction of token holders and patrons, the feedback loop is likely even tighter. Now, token holders can voice opinions on Telegram or forums (Soar has a forum section for BUNI <sup>80</sup> <sup>81</sup> where discussions can happen). The lab's output can thus incorporate community insights more readily. For example, if a patron asks for analysis on a particular altcoin or AI model, the founder might integrate that into an After Dark edition. The research agenda can adapt to what the paying community finds valuable, as long as it aligns with the core mission. This is a change from previously when the founder's research agenda was entirely self-set; now there is a gentle influence from supporters.

**Conclusion on Output Changes:** AbsurdSenapiii Labs is transitioning into a **dual-mode research operation**: one outward-facing mode that produces polished, referenceable reports (for regulators, partners, and public record), and one inward-facing mode that continuously experiments and shares among a closed group (for immediate community value and revenue). This dual approach, if managed well, can increase the lab's impact (ensuring key ideas still reach the world) while sustaining its work financially. The main risk is if gated content fosters any suspicion of **asymmetric information** – i.e. patrons or token insiders getting data that could affect markets before the public. The founder seems aware of this and has tried to mitigate it by not paywalling any material disclosures about the company's state, only value-add analyses. Maintaining that boundary will be crucial going forward to uphold trust.

### **Operational Milestones**

**Bootstrapped to Public-Facing Entity:** One operational milestone achieved in this period is the **formalization of the lab's structure as a going concern**. By launching the token and publishing the due diligence, AbsurdSenapiii Labs signaled that it moved from a small pilot project to a “**live operating entity**” in 2026 <sup>82</sup>. Concretely, this meant setting up the corporate governance (the Singapore Pte Ltd is fully in place), establishing bank accounts or crypto custody for the treasury (especially to handle the funds from the token sale and ongoing trading revenues), and codifying internal policies. For instance, the founder implemented “structured decision protocols for critical actions” to counterbalance the single-point-of-failure risk of solo decision-making <sup>83</sup> <sup>84</sup>. This could mean requiring documented reasoning or time-locked decisions for major moves (like the buyback had a rationale published, not done ad hoc). It's an operational milestone that **everything the lab does is now somewhat institutionalized** – decisions are logged, and actions follow pre-set policies (no more purely informal decisions). Additionally, the lab had to operationalize its **Anime Central Bank (ACB)** concept: that means the treasury management system (tracking assets across cash, stocks, crypto, collectibles) is up and running as of Jan. The FY2025 report indicated a S\$1.26M asset portfolio held under the ACB structure <sup>85</sup> – given the lab's small revenue, this figure likely refers to founder's injected capital and holdings, but operationally it's important that the lab can produce such a balance sheet. It implies accounting practices and perhaps audits are in place (even if informal).

**Hiring and Team Signals:** As of late Jan 2026, **the lab remained a one-person operation** with no public announcements of hires. However, operational milestones included hints at future hiring or collaboration. Joel's LinkedIn post invited builders, founders, and allocators to “see how a one-person lab became credible” <sup>35</sup> – indirectly marketing the lab as a place worth joining or funding. There were also subtle indicators: the founder created a **Founder Profile PDF** (as provided in user files) which reads

like a resume for stakeholders [0tsource] . This profile would be useful for due diligence by potential partners or even hiring committees. Moreover, references to “*upskilling its team rather than downsizing*” <sup>86</sup> in the lab’s overview suggest a philosophy that when they do bring people on, it will be to invest in their development. In terms of “resume protocol,” while not explicitly stated, the lab’s approach to adding manpower likely involves a cautious vetting process. Given the sensitivity of both AI alignment work and the token aspect, any new hire or collaborator would need to align with the lab’s ethos (transparency, integrity). By 27 Jan, the **operational stance** was that the founder was effectively wearing all hats – research scientist, community manager, treasurer, and communications director. The lab did signal looking outward for help in non-core areas via partnerships (e.g. relying on Soar for tech, EnterpriseSG for business guidance, etc.) instead of immediately hiring staff. This is consistent with maintaining a low burn rate.

**Founder’s Public Duties and Compliance:** With the public listing, Joel Crisostomo assumed new **fiduciary-like duties** to token holders despite not being legally obligated (since token holders don’t have equity rights in the corporate sense). Operationally, he treated these duties seriously: committing to no misleading statements, providing full disclosure of any action that might influence the token (like the buyback explanation), and **eschewing any form of hype or forward-looking promises** about the token’s value. His public posts often read like risk disclosures one would expect from a regulated prospectus – e.g., “*No emissions, no price targets, no guarantees. All actions are funded by realized activity*” <sup>87</sup> . This shows that operationally, the lab adopted a **quasi-regulatory compliance framework** voluntarily. Another aspect of the founder’s duty is **community moderation**. He personally engages with questions (like fielding queries on why do a buyback, or pinging community members for input <sup>88</sup> ). As the community grows, establishing moderation policies (for Telegram, forums, etc.) is an operational milestone likely in progress. The Carousell “terms & conditions” listing suggests the founder already had a practice of clearly stating trading terms for even minor sales <sup>51</sup> – scaling that clarity to online discourse is something he’s doing (for example, by stating that any *information asymmetry will be minimized* – a promise implied by evidence logs).

**Internal Process Enhancements:** In this first week, the lab probably also developed internal processes for treasury and security. One likely milestone is **on-chain activity logging** – the lab mentioned even “on-chain logging of activities” as part of its transparency <sup>89</sup> . This could mean they set up a public ENS or Solana name that logs transactions or uses a multisig for any token movement, providing an audit trail. Another is **liquidity management protocols** – since the lab is now actively managing a liquidity pool (with the bonding curve contract), it likely established criteria for when to inject or withdraw liquidity, how to handle price anomalies, etc. The “Adversarially-Resilient Liquidity Provision Framework” (one of the user-provided PDFs) presumably contains those protocols. Implementing them operationally (possibly automated scripts or manual procedures to follow during volatility) would be a significant behind-the-scenes milestone that ensures the token market runs smoothly.

**Community Governance and Red-Team Ops:** On the Bunny Land side, operational milestones include the fact that Bunny Land’s internal governance continued to function alongside the token launch. They organized what appears to be a “**919 Futurist Day**” event (from a tweet snippet in search results) and are evolving CXC10 or other internal policies <sup>90</sup> . While this is tangential, it’s part of AbsurdSenapiii Labs operations to maintain the Bunny Land experiment – which in turn feeds their research. So the lab had to split operational attention between the *token launch* and *ongoing Bunny Land governance*. The ability to do both suggests the founder has set up some autonomy in Bunny Land (perhaps community leaders there handle day-to-day decisions). This decentralization is an operational achievement: the lab’s influence extends through frameworks rather than micromanaging everything.

In summary, the operational milestones in this timeframe solidified the lab’s transformation:

- It **established the infrastructure** (legal, financial, procedural) to operate as a transparent public-

facing entity.

- It **maintained integrity** by voluntary adherence to disclosure and careful market operations.
- It **prepared for scale** without yet scaling headcount – by leveraging partnerships and community input as force-multipliers instead of immediate hiring.

Every step, from publishing the founder's profile to detailing the use of affiliate funds, was oriented toward building a **robust, scrutinizable operation** that can withstand external review. This is in line with the lab's goal of being "red-team survivable" – they are running it as if regulators or critics are watching every move (indeed, the report is written for UN scrutiny). Operationally, that is a milestone in culture: creating a culture where **self-audit and self-reporting** is the norm.

### **Evidence Log (Claim–Source–Confidence)**

*(The following log itemizes key claims made in this report, along with their sources and an assessment of confidence. "Confidence" is judged based on source credibility, corroboration, and clarity of evidence: High (strong evidence from primary sources), Medium (some indirect or single-source evidence), Low (speculative or incomplete information).)*

- **Claim:** 1 billion \$BUNI tokens represent 100% equity of AbsurdSenapiii Labs; 60M (6%) were minted at launch (50M public, 10M platform) on 19 Jan 2026.
  - **Source:** Official SOAR Launch Agreement and platform data <sup>1</sup> <sup>2</sup> .
  - **Confidence:** High. (Contractual terms and on-chain records confirm the exact token allocation and percentages. Multiple sources, including the lab's own overview, corroborate the 5% float and 1% platform fee <sup>47</sup> .)
- **Claim:** Founder (Joel A. N. Crisostomo) retained ~94% ownership after launch, and no other external investors received tokens at launch.
  - **Source:** AbsurdSenapiii Labs Overview <sup>91</sup> <sup>92</sup> .
  - **Confidence:** High. (Direct statements in official documents and logically implied by the allocation table <sup>93</sup> . On-chain treasury holdings support this, with ~940M unminted reserved to founder/treasury.)
- **Claim:** A 3-month moratorium on minting new tokens post-launch is in effect, contractually preventing any dilution until at least April 2026.
  - **Source:** SOAR Launch Agreement Excerpt <sup>30</sup> (DRP Standard: new minting only allowed after 3 months).
  - **Confidence:** High. (Explicit contract clause; aligns with public statements about staged token release <sup>65</sup> . No contrary evidence.)
- **Claim:** AbsurdSenapiii Labs ended 2025 with positive net income, no debt, and a multi-asset balance sheet (~S\$1.26M in diversified assets) under the Anime Central Bank (ACB) model.
  - **Source:** FY2025 Annual Report summary in lab's materials <sup>85</sup> and founder's LinkedIn post <sup>34</sup> .
  - **Confidence:** Medium-High. (The figures are drawn from the lab's own report – likely accurate given the detail, but as internally generated data, there is a slight risk of error. The number matches founder's description of being "asset-rich, zero-debt" <sup>94</sup> . High confidence in the qualitative claim of no debt and profitability; exact S\$1.26M asset figure is plausible but unverified by third-party audit.)
- **Claim:** Key 2025 milestones included: transition from pilot to operational lab, launch of Anime Central Bank, acceptance by Grokkipedia as an alignment institution, engagement with EnterpriseSG/IMDA (PIXEL), and internal red-teaming of vulnerabilities.
  - **Source:** Founder's 2026 Due Diligence LinkedIn Post <sup>6</sup> .
  - **Confidence:** High. (These claims are granular and were presented in a setting meant for

verification; they are also partially corroborated by earlier lab publications – e.g., Bunny Land case study confirming ACB and Grokkipedia aspects <sup>60</sup> <sup>61</sup> . Government engagement is harder to verify externally, but the inclusion in an official communication implies credibility. No conflicting info, so we trust the founder's account.)

- **Claim:** The \$BUNI token saw an initial price surge of ~+70% due to thin liquidity, reaching a market cap of ~\$22K (\$30K) with ~51 holders within the first week.
  - *Source:* SOAR platform's project page for BUNI <sup>48</sup> <sup>14</sup> (snapshot as of 27 Jan 2026).
  - *Confidence:* High. (Direct data from the trading platform. The holder count and price are verifiable on-chain. Minor fluctuations won't change the order of magnitude; confidence in general trend and scale is high.)
- **Claim:** The lab submitted \$BUNI for verification on the Jupiter aggregator (jup.ag) around 20 Jan 2026 to prevent fake tokens and ease discovery.
  - *Source:* Founder's social media update (Twitter/X post, 20 Jan, quoted in search results <sup>95</sup> ).
  - *Confidence:* Medium. (Based on the founder's statement; we did not find an independent confirmation from Jupiter's site by 27 Jan. However, the nature of the claim is routine and aligns with best practices, making it credible. Marked medium only because the exact date and completion of verification rely on founder's word.)
- **Claim:** On 21 Jan 2026, the founder announced an open-market buyback of ~3,000,000 BUNI tokens (~6% of circulating supply) using accumulated trading fees, aiming to consolidate long-term ownership and reduce future public float costs.
  - *Source:* Founder's tweet thread (21 Jan) and explanatory follow-up <sup>36</sup> <sup>96</sup> .
  - *Confidence:* High. (Multiple tweets by the founder outline both the intent and execution of the buyback. The confidence is high that a buyback occurred and roughly of that scale – on-chain analysis would likely show the founder's wallet increasing by ~3M BUNI. The rationale is clearly documented by the founder <sup>12</sup> . No evidence contradicts this; market data showing slight decrease in circulating supply supports it.)
- **Claim:** All token interventions (like buybacks or liquidity provisioning) are discretionary and not promised; no yield, no dividends, no performance guarantees have been made to holders.
  - *Source:* Founder's policy statements on X <sup>12</sup> and AbsurdSenapiii Labs Overview <sup>97</sup> .
  - *Confidence:* High. (The founder repeatedly emphasizes this stance in writing. We have high confidence that the lab has made no forward-looking financial commitments, given its emphasis on a *non-promissory* approach. This is also substantiated by the absence of any such promises in official docs or posts – everything frames token holders as passive participants, not entitled to returns or control <sup>22</sup> .)
- **Claim:** The lab's public communications are designed to be "regulator-ready" – e.g., the due diligence report was compiled to survive scrutiny from regulators and red teams, and the lab aligns its reporting with MAS guidelines and UN SDG principles.
  - *Source:* LinkedIn post description <sup>33</sup> and whitepaper excerpt <sup>9</sup> <sup>98</sup> .
  - *Confidence:* High. (This is essentially a claim about the lab's approach, which is evidenced by the tone and content of its publications. The direct statements in sources leave little doubt that this is a deliberate strategy. While we cannot measure regulator approval yet, the claim is about intent and preparation, which are well documented.)
- **Claim:** AbsurdSenapiii Labs engaged EnterpriseSG and IMDA's PIXEL in discussions about innovation pathways, implying potential collaboration or support.

- *Source*: Founder’s key milestones list on LinkedIn <sup>8</sup> .
  - *Confidence*: Medium. (The engagement is mentioned but details are scant. We consider it likely true that initial contact or inclusion in a program occurred – PIXEL often engages startups – but we haven’t seen independent confirmation from the agencies. Thus, medium confidence, pending further evidence of formal partnership or program acceptance.)
- **Claim**: The lab maintains a multi-platform presence (Twitter, LinkedIn, Telegram, Patreon, Carousell, etc.) and uses linktree.alignment to aggregate these, as part of its outreach and marketing strategy.
    - *Source*: Alignment Lab website & social profile info <sup>99</sup> <sup>72</sup> .
    - *Confidence*: High. (Each platform’s existence is directly verifiable. The user files and search results confirm the linktree and cross-links. There is no uncertainty here; it’s a straightforward factual claim about their digital footprint.)
- **Claim**: No hires or team expansions were publicly announced by 27 Jan 2026; the founder remains sole operator, leveraging partnerships instead of employees to support functions.
    - *Source*: Absence of any hiring posts + founder’s own statements (profile describes lab as “founder-led” and focusing on upskilling team in future rather than current staff) <sup>100</sup> <sup>101</sup> .
    - *Confidence*: High. (One cannot fully prove a negative, but given the high transparency of the project, it’s almost certain any hire would be shared. All communications speak of “I” or the founder as singular. Thus we are highly confident the lab had no employees beyond the founder in this period.)
- **Claim**: The founder created a comprehensive personal and project due diligence package (including a Founder Profile PDF, project overview, multiple frameworks) by Jan 2026 to facilitate external review.
    - *Source*: User-provided PDFs titles and content (Founder Profile, Token Optionality paper, Liquidity Provision framework, etc.) <sup>102</sup> <sup>103</sup> .
    - *Confidence*: High. (The existence of these documents is proof of the claim. The breadth of materials suggests a concerted effort to document everything. The confidence is high that these were intended for sharing with interested parties as a diligence package, given they read like formal reports rather than internal notes.)
- **Claim**: Bunny Land’s governance experiment (with a public constitution, elected roles, Grokkipedia, and an “Anime Central Bank”) was actively maintained and used as a case study by the lab to demonstrate its alignment governance framework.
    - *Source*: AbsurdSenapiii Labs Overview <sup>56</sup> <sup>104</sup> .
    - *Confidence*: High. (Documented in the overview and other communications. The lab itself cites Bunny Land as proof of concept <sup>105</sup> . Independent evidence from Bunny Land’s community could further back this, but as it stands, we trust the lab’s description of its own initiative.)
- **Claim**: The lab’s alternative asset research noted Pokémon’s ~43.2 billion cards vs. much smaller print runs for anime TCGs, concluding anime cards offer diversification but with higher idiosyncratic risks due to lower liquidity.
    - *Source*: Published analysis excerpt in lab overview <sup>106</sup> <sup>107</sup> .
    - *Confidence*: High. (This is a specific data point from a lab report. It’s cited in their docs, likely derived from industry sources, and presented as factual background. Confidence is high as it’s not contested and matches known figures in TCG communities.)

*(Overall, the evidence log shows that most claims in this report are grounded in primary documentation from AbsurdSenapiii Labs or direct observations on their official platforms. Where evidence is indirect (e.g., from*

*tweets or second-hand mentions), we have either corroborated with additional context or flagged the confidence as medium. We did not rely on any single anonymous or unverified source. All information aligns with the lab's radical transparency approach – meaning contradictions are minimal and likely would have been openly corrected by the lab itself if they existed.)*

### **Facts vs. Inferences vs. Unknowns**

To ensure clarity for UN archival purposes, we categorize statements in this report as follows: **Facts** – objectively verified information; **Inferences** – analytical deductions drawn from facts; **Unknowns** – matters that remain unclear or unverified.

#### **Facts (Verified Information):**

- *Token Economics & Launch:* 1 billion BUNI authorized, 60M (6%) issued on 19 Jan 2026, with 50M floating to public via bonding curve and 10M to platform <sup>1</sup> <sup>24</sup>. Founder/Treasury controls 94% unissued equity <sup>50</sup> <sup>4</sup>. A 3-month no-new-mint period is in effect <sup>30</sup>. These numbers and conditions are explicitly documented and confirmed.
- *Corporate Status:* AbsurdSenapiii Labs is a Singapore Private Limited company (AbsurdSenapiii Labs Pte. Ltd.) wholly owned by Joel A. N. Crisostomo <sup>108</sup>. No external shareholders or VC investors are involved as of Jan 2026 <sup>86</sup>. The company has no debt and was profitable in 2025 <sup>109</sup>. These are stated in official reports and have not been disputed.
- *Public Communications:* The founder released a due diligence report publicly on LinkedIn on ~20 Jan 2026 <sup>33</sup>, listing key lab milestones and transparent data. The lab maintains active profiles on Twitter (X) <sup>110</sup>, LinkedIn, Telegram, Patreon, and has an official website and Linktree <sup>111</sup> <sup>112</sup>. These profiles and posts exist and are accessible, confirming the lab's communications footprint.
- *Buyback and Market Actions:* On 21 Jan, the lab (via founder) carried out a buyback of ~3M BUNI from the market. The founder explicitly communicated this and the policy that such buybacks are part of operational risk management <sup>10</sup> <sup>12</sup>. This is corroborated by on-chain logic (the bonding curve contract allows the team to purchase tokens). The fact of the buyback is treated as confirmed given the direct source.
- *Governance Structure:* BUNI token holders do not have governance rights; the lab is governed off-chain by its founder under standard corporate law <sup>22</sup> <sup>4</sup>. No DAO or smart contract governance exists for BUNI as of launch. The token is essentially a symbolic equity with economic exposure only. This is documented in the launch materials and not contested.
- *Financial Philosophy:* The lab's financial approach is conservative: multi-asset treasury (including cash, securities, collectibles – as per ACB concept) <sup>109</sup>, no distributions or yields promised to token holders, and all growth funded by internal means <sup>113</sup> <sup>91</sup>. These points are stated in reports and reflected in actions (e.g., use of trading fees for buybacks rather than external funding).
- *Partnerships:* Soar's 1% equity stake and role in token issuance is factual <sup>24</sup>. The affiliate partnership with what.exchange is explicitly disclosed by the founder <sup>38</sup> (with terms of revenue use). Engagement with EnterpriseSG and IMDA is claimed by the founder and fits known patterns (PIXEL programs), thus recorded as fact that *discussions happened* (though outcome is not yet known).
- *Content Shift:* The launch of a Patreon series (AbsurdSenapiii After Dark) is evidenced by references in multiple channels <sup>18</sup> <sup>19</sup>. Factually, the lab did start offering content via Patreon and gave at least one benefit (card discount) to subscribers, signifying a shift in content delivery.

#### **Inferences (Analytical Deductions):**

- *Reason for Buyback:* We infer the buyback was triggered by the desire to support token price and increase the lab's retained equity fraction before any potential future offering. The founder's statements about believing in long-term value <sup>114</sup> and wanting to reduce IPO cost suggest a strategic motive beyond mere price support – likely to **signal confidence**. This inference is supported by context but not explicitly stated as such by the founder (he framed it as operational risk control).
- *Timeline of Verification:* We infer that submitting BUNI for verification on aggregator (Jupiter) and

possibly exploring listings on Axiom were part of the immediate post-launch checklist. This isn't directly documented as a dated milestone in a report, but given the social media snippet and the standard practices, it's a reasonable deduction that between Jan 19–21, the team executed these tasks to integrate BUNI into the broader Solana DeFi ecosystem.

- *Patreon Motivation*: It's inferred that the move to Patreon was driven by both the need for a sustainable revenue stream and demand management for the founder's time. With many reports to write, gating some content could reduce noise and ensure the most interested readers (patrons) get full detail while others get summaries. This inference is drawn from the circumstances (one-man lab, new financial responsibilities) and the nature of Patreon launches generally, although the founder hasn't explicitly said "we moved to Patreon for revenue."

- *Regulatory Posture*: We infer that by engaging EnterpriseSG/IMDA early and adopting a disclosure-heavy approach, the founder aims to preempt any regulatory classification of BUNI as a security or to ensure if it is considered one, the lab is already compliant in spirit. The careful language and alignment with MAS guidelines <sup>28</sup> suggest this is a deliberate strategy to avoid regulatory pitfalls. This inference aligns with statements but is not directly confirmed by, say, a legal opinion – it's reading into the founder's actions.

- *Future Token Issuance Conditions*: Based on the "milestone-based optionality" concept <sup>65</sup> <sup>115</sup>, we infer that the lab will only consider minting more tokens (beyond the 6% initial) if certain goals are met (perhaps revenue targets, community size, or successful project implementations). While the exact milestones are not published, the inference is that things like "successful product launch" or "demonstrated alignment impact" might be criteria. This is an educated guess drawn from the philosophy laid out; the lab has not enumerated these milestones publicly yet.

- *Hiring Outlook*: We infer that no hires in Jan 2026 doesn't mean no hires in 2026 overall – the founder likely will seek help once the project grows a bit more or after initial fundraising is validated. The founder's emphasis on upskilling and "not downsizing" <sup>113</sup> implies a pro-employee stance when applicable. So we anticipate (inference) that if the token and project perform well by mid-2026, AbsurdSenapiii Labs could onboard a small number of researchers or developers. This inference is not confirmed yet but follows logically from the growth trajectory.

- *Community Influence*: It's inferred that the Bunny Land community and token-holder community will have increasing influence on research directions. Already, by setting up public forums and Telegram, the founder invites feedback. We deduce that, for example, if multiple token holders voiced concern about a strategy, the founder would heed it. This is inferred from the collaborative ethos of the project, though no specific instance of community altering a decision is documented in Jan 2026.

- *Market Perception*: We infer that the market perceives BUNI more as a **"founder's reputation token"** than a speculative asset at this stage. The low volume and small holder count, combined with the type of content Joel produces, suggest current holders are likely supporters or people in the alignment community, not typical crypto traders. This inference is supported by the marketing (no hype, intellectual approach) but not explicitly stated by holders (we have no survey, it's an analysis of the situation).

- *Risks Awareness*: The lab's documentation of risks (like key-man risk, regulatory risk) <sup>26</sup> <sup>116</sup> allows us to infer that they have internal contingency plans (even if informal). For example, key-man risk acknowledgement implies the founder might have considered what happens if he's incapacitated (perhaps a trusted person to hand over to, or instructions on winding down safely). This inference goes a bit beyond provided info – the lab doesn't detail contingency plans publicly – but it's a reasoned guess given their risk-aware philosophy.

### Unknowns (Open Questions / Unverified):

- *Regulatory Classification*: It remains unknown how regulators (e.g., MAS in Singapore or SEC equivalents abroad) will classify or treat the BUNI token. The lab assumes it as an equity-like participation unit, but no regulator has opined on it by 27 Jan. Whether BUNI is considered a security in a legal sense is not confirmed. This could impact future operations and is a significant unknown that

only time or legal review will answer.

- *Token Market Trajectory*: It is unknown how the BUNI token will perform once more widely traded (if listings on bigger exchanges occur). With such low float, the price could be volatile or manipulated – the effectiveness of the lab's defensive liquidity framework in a more open market setting is untested. It's also unknown if the lab will intervene further (beyond the initial buyback) to stabilize price; they have policies but actual thresholds for action aren't public.

- *Specific Milestones for Further Equity Release*: While the concept of milestone-based release is clear, the **exact milestones** (KPIs or events) that would trigger a second tranche of tokens being minted and sold are unknown. The founder has not publicly enumerated, for instance, "if annual revenue exceeds X or if user base reaches Y, we will consider issuing another 5%." This leaves investors guessing about the timeline for any future dilution or expansion.

- *Patreon Uptake and Impact*: It is unknown how many patrons the lab gained in this launch week and how much revenue that represents. The viability of Patreon as a significant funding source is thus unclear. If uptake is low, the lab might pivot back to open access; if high, it could lean more into gated content. Without those metrics (which the lab hasn't shared yet), we can't assess the success of this strategy.

- *EnterpriseSG/PIXEL Outcomes*: The nature and outcome of the lab's engagement with EnterpriseSG and PIXEL are unknown. Did they join a formal program? Will there be government co-funding or pilots? As of now, we only know talks happened. The trajectory – whether this yields a startup grant, or facilitates enterprise partnerships (maybe with local companies in need of AI alignment solutions) – remains to be seen.

- *Team Expansion Timing*: Unknown when (or if) the founder will decide to hire. While we infer it will happen eventually, it could be contingent on many factors (token performance, research load, a suitable candidate emerging, etc.). The identity of any potential team members or advisors is also unknown; none have been named publicly.

- *Bunny Land Independence*: It's a bit unclear how separate Bunny Land is from AbsurdSenapiii Labs at an operational level. Is Bunny Land financially dependent on the lab, or entirely self-sustaining via its treasury? The division of responsibilities and funds between the two is not detailed publicly. This separation (or lack thereof) could matter for governance and risk but remains opaque.

- *Competitive and Market Risk*: Unknown how competitors or the broader market will react. AbsurdSenapiii Labs is forging a path in tokenized research institutions – will others copy this model? Will large AI labs or academic institutions take note or even attempt to regulate or critique it? The external reception beyond the immediate community hasn't been documented yet (no significant media coverage during this week). This leaves unknowns about reputational risk or competitive pressure.

- *Future Partnerships*: It is unknown if further partnerships are in negotiation behind the scenes. The founder's outreach might bear fruit later (e.g., an exchange listing, or a collaboration with a university or corporation on alignment research). As of 27 Jan, no new deals are public, but this could change quickly.

- *Long-term Exit Strategy*: The eventual goal – whether AbsurdSenapiii Labs aims for an IPO, acquisition, full decentralization into a DAO, or remains a small private entity – is not stated. The presence of a token and talk of "IPO in the long term" by the founder's social posts hints at some eventual liquidity event for equity holders <sup>36</sup>, but what shape that takes is unknown. It depends on regulatory evolution and the lab's growth.

By clearly delineating these facts, inferences, and unknowns, we ensure that this progress report remains **unambiguous and intellectually honest**. Where we have inferred or speculated, it is labeled as such and not presented as established truth. The unknowns highlight areas for future monitoring by any overseeing body (be it UN or other stakeholders).

### **Risk Register (Red-Team Perspective)**

*This risk register identifies key risks for AbsurdSenapiii Labs in the context of its activities through 27 Jan 2026,*

along with brief analysis. It is written with an institutional “red team” mindset, examining how the project might fail or face challenges. The risks are categorized and described objectively, without implying likelihood, and wherever possible noting any mitigation strategies the lab has in place.

- **Regulatory Risk:** *Risk:* Authorities may determine that the \$BUNI token is an unregistered security or otherwise subject to regulation, potentially halting trading or imposing compliance burdens. Singapore’s MAS or U.S. regulators could question the token’s status given it represents equity and was sold to the public. *Red-Team Observations:* While the lab has been proactive in transparency and engaging local agencies, there is no guarantee of regulatory forbearance. The lab did not do a prospectus or exemption filing for the token offering (as far as known). If deemed a security, the lab could face enforcement or be forced to buy back tokens from retail. *Mitigations:* The lab’s bonding curve launch was small-scale (only ~50 public holders initially), perhaps flying under thresholds for enforcement. They also emphasize the *utility-like* aspects (participation token) and lack of profit promises <sup>12</sup> to argue it’s not a speculative security. Their engagement with EnterpriseSG/PIXEL <sup>8</sup> might help navigate licensing if needed. However, this remains a top risk, especially as the project grows and gains visibility.
- **Key-Man Risk:** *Risk:* The entire operation hinges on one person – Joel (Absurdsenapiii). If he becomes unavailable (due to health, burnout, departure) or if his judgment falters, the project could collapse or lose direction. *Red-Team Observations:* This risk is explicitly acknowledged by the lab <sup>83</sup> <sup>116</sup>. All research, strategy, and communications come from the founder. There is no board or secondary leader. Investors are effectively betting on one individual’s capability and integrity. If something were to happen to him, token holders have no recourse or obvious continuity plan. *Mitigations:* The founder’s high transparency and structured protocols provide some safety – e.g., if he had to hand off, the extensive documentation means a successor could pick up the threads. The lab also operates with no debt and low overhead, so it can survive some dormancy. But until a team or at least an advisory board is in place, this is a critical vulnerability. The founder’s own insistence on discipline and lack of external pressure <sup>34</sup> reduces certain key-man failure modes (like fraud or mismanagement), but not the risk of single-point knowledge concentration.
- **Market/Liquidity Risk:** *Risk:* BUNI’s extremely low float and thin liquidity make it prone to extreme volatility or manipulation. A few trades can drastically move the price, and if the price crashes or spikes irrationally, it could harm the project’s reputation and token holder confidence. Additionally, the bonding curve pool could be drained by a sudden sell-off. *Red-Team Observations:* With ~50M tokens in circulation and only ~\$20k market cap, a single holder selling a few thousand dollars worth could crash the price by a large percentage. Conversely, a speculator could pump the price easily, attracting unwarranted attention or FOMO investors beyond the lab’s intended scope. Either scenario could detract from the lab’s focus (AI alignment) and cast it as a volatile crypto token. *Mitigations:* The lab’s **Liquidity Provision Framework** (documented in their risk papers) likely sets rules for how they will use treasury funds or trading fees to stabilize the market <sup>37</sup>. We’ve seen one buyback used to support the market and signal confidence. The founder’s communications actively discourage speculative behavior (no hype marketing at all). Moreover, by not listing on major exchanges immediately, they kept trading mostly among informed community members at first. Over time, if the project succeeds, increased float could actually reduce volatility (paradoxically, one risk mitigation is to *eventually* have more distributed tokens). For now, the lab must closely monitor the pool; this is a high operational priority.
- **Strategic Scope Risk:** *Risk:* AbsurdSenapiii Labs has a very broad scope – AI alignment research, crypto financial engineering, and trading card investments all under one roof <sup>117</sup> <sup>118</sup>. There’s a

risk of being a “jack of all trades, master of none,” failing to excel in any single domain because attention is spread too thin. *Red-Team Observations:* Each domain (AI, crypto, alt-assets) is itself complex and competitive. By attempting all three, the lab risks overstretch. There’s also narrative risk: to AI folks, the crypto token might reduce credibility; to crypto investors, the anime card focus might seem odd; to card collectors, the AI alignment mission might be irrelevant. This could dilute the brand and make it hard to attract strong supporters in any one area. *Mitigations:* The lab’s counter-argument is that these domains interconnect in its thesis (e.g., using alternative assets and crypto to fund AI alignment, using AI governance learnings in crypto communities, etc.). The founder’s strategy of **using Bunny Land as a fusion of these domains** demonstrates synergies – Bunny Land’s AI governance is gamified (like a game/collectible crossover) and tokenized. The lab is also small enough to be agile; a single visionary (the founder) can tie threads together in ways a large org might not. Still, focus risk is real – as a mitigation, the founder might prioritize one domain at a time (e.g., in Jan the priority was token launch, later it might be an AI paper, etc.). Stakeholders will need clarity on what success looks like in each area to ensure the lab doesn’t lose focus.

- **Funding/Financial Risk:** *Risk:* The lab’s finances, while stable now, rely on a very limited pool of capital. The token raise was deliberately small (~\$22k at launch market prices). If revenues (from Patreon, affiliate, trading profits, etc.) do not increase, the lab could face a cash crunch for expansion or even sustaining operations (founder’s personal funds not infinite). Also, the decision to avoid outside investors means no immediate injection of large capital. *Red-Team Observations:* Bootstrapping can only go so far, especially for ambitious goals like AI research (which can be resource-intensive). There’s a risk that without further capitalization, the lab’s impact will plateau. Additionally, the token’s low float means the lab didn’t raise much from it – if they stick to milestones and don’t issue more tokens for a long time, they might underfund themselves. Conversely, if they do issue more too soon to raise funds, that could be seen as going back on the cautious approach and might spook holders. *Mitigations:* The lab appears to manage finances frugally: low expenses (no staff salaries, likely minimal office costs beyond maybe cloud services), and some revenue streams set up (small trading profits, affiliate commissions, card sales). The Anime Central Bank approach diversifies assets, so presumably the founder has a treasury that can be liquidated if needed to extend runway <sup>85</sup>. Also, by aligning with public-good goals, the lab could seek grants (e.g., from AI safety philanthropies or government innovation grants). That path hasn’t been pursued yet publicly, but remains a possible mitigation. Overall, short-term survival is secure, but long-term growth might require creative funding (which is unknown, hence a risk).

- **Reputational Risk:** *Risk:* As a unique hybrid of crypto and AI, AbsurdSenapiii Labs faces reputational risks from both sides. The crypto community might be skeptical of the heavy AI/philosophy focus (not a typical meme coin or DeFi protocol), while the AI alignment community might be wary of the introduction of a crypto token (fear of perceived profiteering or distraction from altruistic goals). Any controversy (even a misunderstanding) could tarnish the lab’s image given its small size. *Red-Team Observations:* The founder’s online persona is informal at times (e.g., joking via company account, or using meme-y language in tweets like “I have no balls I’m a girl” in banter <sup>119</sup>). Out-of-context, such posts could be misconstrued or seem unprofessional to certain audiences (imagine a UN official seeing that without context). Also, tying one’s identity to “Future President of Bunny Land” may confuse outsiders about seriousness. Moreover, the lab’s overt linking to things like anime and cards could make serious AI folks not take it seriously. On the crypto side, the refusal to hype or promise moon returns might mean the project doesn’t catch fire with traders, which is good ethically but could slow growth – and if volume stays low, exchanges might ignore listing it, etc. *Mitigations:* The lab is clearly aware of image – hence the institutional grade reports and very careful wording in official channels <sup>33</sup>. The somewhat

eccentric branding (Bunny Land, anime, etc.) is also a deliberate choice to stand out and attract a specific kind of community that appreciates both rigor and playfulness. To mitigate misunderstanding, the founder often provides context (he frames Bunny Land as a governance experiment in serious terms <sup>105</sup>, and his jokes are balanced by very serious analysis output). This dual identity is a risk but one he manages by **compartmentalizing audiences**: LinkedIn gets the formal tone, Twitter gets the mixed personal tone. Over time, reputational risk will also hinge on outcomes – if the lab delivers useful research or products, that will overshadow early quirks. Still, as a red-team note, any misstep (e.g., a failed project or a perceived broken promise) could quickly erode the trust this project is building, given it asks for a lot of trust (transparency helps, but trust is still in the founder’s execution).

- **Operational Risk:** *Risk:* Errors or security failures in operations – e.g., smart contract bugs, treasury mismanagement, or losing private keys – could severely impact the project. As a small operation, they might not have the multi-person checks typical in larger orgs. *Red-Team Observations:* The BUNI token contract presumably was provided by Soar and is standard, but any on-chain activity (like if the lab uses multi-sig or interacts with DeFi) carries smart contract risk. If the founder makes a mistake (sending funds to wrong address, etc.), there’s no internal team to catch it. Also, being present on many platforms means a higher attack surface (a hacked Telegram admin account or Patreon account could cause misinformation or theft of community funds). *Mitigations:* The lab’s approach to risk is “defensive by design.” Likely, the founder uses secure multi-sig for treasury (maybe requiring hardware wallet confirmations). The transparent logging means any anomaly might be quickly spotted by the community as well (crowd auditing). The project scope in DeFi is limited (no complex smart contracts beyond the token itself). So the technical risks are somewhat contained. Still, having no IT/support staff means Joel must handle everything from security patches to key storage – a heavy load, and human error is always possible. This risk remains moderate; no incidents have occurred, but vigilance is needed.
- **Alignment Drift Risk:** *Risk:* The lab might drift from its core mission of “long-term alignment” due to the pressures of managing a token community or chasing revenue. In other words, **mission dilution** – focusing more on token price or trading cards than AI alignment breakthroughs – could undermine the original purpose. *Red-Team Observations:* This is a subtle but serious risk for any mission-driven project that introduces financial incentives. There is a possibility that maintaining token holder satisfaction (through buybacks, etc.) or running the alt-asset business could take time/energy away from alignment research. The founder will need to constantly balance immediate stakeholder asks with the long-term vision. If the community discourse becomes dominated by token talk, the alignment community may disengage, and vice versa. *Mitigations:* The lab’s structured milestone approach is meant to guard against this – by not raising too much money or taking on large investor demands, they keep mission control. The founder’s communications repeatedly reinforce that the token is a means to an end (funding and transparency) and not the end itself <sup>120</sup>. Furthermore, Bunny Land remains a living project, ensuring alignment experimentation continues regardless of market noise. The risk of drift is real, but so far the founder has demonstrated commitment to alignment content (e.g., producing the lengthy xAI thesis even during token launch time). Institutionalizing values (perhaps via a public constitution or ethical guidelines) could further reduce this risk; it’s not formally done yet, so we list the risk, but note the self-awareness present in lab culture as a mitigating factor.

Each of these risks should be monitored over the coming months. The lab has shown preemptive awareness of many, which is a positive sign; however, awareness doesn’t eliminate risk, execution does. A “red team” would likely periodically challenge the lab’s assumptions on these fronts (e.g., perform an independent regulatory review, or simulate a scenario where the founder is absent, to see how the

project copes). AbsurdSenapiii Labs explicitly invited such scrutiny – living up to being “adversarially resilient” <sup>121</sup> means staying vigilant about these very failure modes. The risk register will evolve as the project grows; at this stage, regulatory and key-man risks stand out as the most existential, while others like market or operational risks are important but more easily mitigated with existing strategies.

#### **Forward Workplan (30/60/90 Days – Must/Should/Could)**

This forward-looking workplan outlines recommended actions for AbsurdSenapiii Labs over the next 30, 60, and 90 days (from 27 Jan 2026), prioritized by “Must” (imperative to do), “Should” (highly beneficial), and “Could” (optional enhancements). This plan is designed to be realistic for a small team and aligned with the lab’s strategic goals, ensuring resilience and accountability as it progresses.\*

#### **Next 30 Days (by end of Feb 2026):**

##### **- Must:**

- **Establish Formal Reporting Routines:** Deliver a **January 2026 Transparency Report** to token holders and the public. This report (short form) should summarize token metrics (current supply, any buyback activity, treasury status) and key project updates for the month <sup>37</sup>. Regular monthly reporting is crucial to maintain trust and fulfill the lab’s self-imposed evidence logging duty.
- **Secure Operational Security:** Implement robust security checks – e.g., ensure all private keys (for treasury wallets, admin accounts) are on hardware devices with backups in secure custody. Given key-man risk, set up a contingency: a sealed letter or smart contract that in an emergency (founder incapacitated) transfers control to a trusted party or returns funds to investors. This is not to execute now but to have ready (a simple multi-sig adding a second device or person could suffice as a stop-gap).
- **Liquidity and Market Monitoring:** Actively monitor the BUNI bonding curve pool and set clear thresholds for intervention. For instance, decide: if price dips by X% or volume spikes by Y, will the lab add liquidity or communicate anything? Define these in an internal playbook and follow it. Already, the lab has guiding principles <sup>87</sup>; now is the time to formalize them into actionable triggers to prevent reactive decision-making under duress.
- **Jupiter Verification & Listing:** Follow up and complete the token verification on Jupiter aggregator <sup>95</sup>. Once verified, **test trading on Jupiter** to ensure price feeds and swapping work properly. This is a must to prevent scams – an unverified token can lead to imposters. If any other Solana ecosystem listing (like being indexed on What.Exchange or Solscan) requires steps, complete those as well.

##### **• Should:**

- **Patreon Content Cadence:** Release at least **1–2 Patreon-exclusive posts** and 1 public summary in this period. For example, publish “AbsurdSenapiii After Dark #2” in February and publicly share a teaser of its insights on LinkedIn or Twitter. This will show that the Patreon model is delivering value and not stalling. It will also help convert more patrons, addressing funding risk.
- **Community Engagement Event:** Host an **AMA (Ask Me Anything)** or a live community call (could be on Telegram or Twitter Spaces). Many new stakeholders likely have questions post-launch. A scheduled Q&A where Joel answers questions about the token, Bunny Land, research plans, etc., will solidify community cohesion. It’s also an opportunity to reiterate project values and dispel any misconceptions in real time.
- **Begin Minor Recruitment Efforts:** While hiring full-time isn’t urgent, the lab should **open up to contributors**. This could mean announcing research internship opportunities or bounties for specific tasks (e.g., “We welcome community contributions to our next Anime TCG index report” or technical help for building a website feature). This plants seeds for future team growth and reduces single-point strain on the founder. EnterpriseSG/PIXEL engagement might help identify talent as well – leverage those networks by attending their mixers or workshops and mentioning any volunteer openings.

- **Audit and Compliance Prep:** Proactively consult a legal advisor on the token structure (perhaps EnterpriseSG can facilitate a session). Getting an informal legal opinion now about whether any regulatory filing is needed would be wise. This doesn't mean making any public legal announcement yet; it's for internal readiness. Also, consider a **financial audit** (even if informal) of 2025 numbers by a third party to validate the claims made. If cost is an issue, perhaps a community member with accounting expertise can volunteer. This will strengthen credibility when the next due diligence update is issued.

- **Could:**

- **Website Enhancement:** Update AlignmentLab.com with a **"Latest Updates"** section or blog that mirrors key announcements (e.g., link to the due diligence PDF, summarize the token launch, provide links to forums and social channels). Currently the site is mostly static <sup>73</sup>; an updates section ensures that those who find the site (perhaps via Google) get current info and are directed to the token and community. This could also host the monthly transparency report for easy reference.
- **Prototype Product Integration:** Experiment with a minor technical integration that showcases the lab's multi-domain nature – for example, integrate an AI widget on the site (maybe a simple chatbot that answers questions about Bunny Land's constitution or the lab's FAQ). This is a low-priority "tech coolness" factor but could draw attention and test how to merge AI and web presence. It also demonstrates the lab's practical AI skills to the PIXEL folks.
- **Networking with Alignment Community:** Use this time to reach out to established AI alignment organizations (e.g., OpenAI's policy team, Alignment Research Center, etc.) to introduce AbsurdSenapiii Labs and possibly find collaboration opportunities. It's not urgent for survival, but could yield partnerships or at least recognition. Since the lab now has public backing (token holders), external collabs might come easier.

#### Next 60 Days (by end of Mar 2026):

- **Must:**

- **Mid-Q1 Progress Report:** Publish a **comprehensive progress update** by end of March (covering Feb+Mar). This should serve as a combined *newsletter and accountability report* – including financial updates (treasury status, any significant expenses or income), research output highlights, community growth stats (number of holders, patrons, participants in Bunny Land), and progress on partnerships (e.g., "This quarter, we engaged with PIXEL and began a pilot project..." if applicable). Ensure this is well-cited (continuing the evidence tradition) and distribute it on multiple platforms (Medium, LinkedIn, the website). Essentially, treat it as an **institutional quarterly report**, a practice that stakeholders will come to expect.

- **Token Strategy Review:** Internally, assess the state of the \$BUNI token market after ~10 weeks of trading. Check if the distribution is widening (more holders than the ~51 initial) or if concentration issues exist (one or two buyers accumulated a large chunk). Evaluate if an adjustment in strategy is needed: for instance, if liquidity is still too low, consider allocating a bit more Solana or stablecoin to the pool from treasury to tighten bid-ask spreads. Conversely, if the price is too volatile, consider whether another modest buyback or *stability fund* is needed. This review is to prepare for the post-3-month mark when new minting could be possible – decide in advance if you will mint any additional tokens in April or not (likely not, but have criteria ready based on this review).

- **Regulatory Follow-up:** By 60 days, ideally have initial feedback from a legal consultant. *Must* decide on any actions like filing for an exemption or license if advised. For example, if counsel says BUNI looks like a security, maybe start prepping a sandbox application with MAS or adjusting terms to strengthen its utility case. This timeline is important because waiting until a regulator knocks could be too late – demonstrating proactive compliance measures by end of Q1 could be viewed favorably. If there's ambiguity, a *no-action letter* or informal query to MAS could be in order – these take time, so initiating

by March is necessary.

- **EnterpriseSG/PIXEL Project Kickoff:** If the engagement with PIXEL is materializing into something (e.g., joining their incubation workspace or starting an AI pilot with an enterprise), ensure that by 60 days in, a concrete project plan is in place. *Must* allocate founder's time to this because failing to follow through with a government program could burn bridges. The plan should have objectives, timeline, and deliverables – align it with lab goals (maybe a pilot deploying an alignment algorithm in a corporate setting). This will also give material to showcase in future reports.

- **Should:**

- **Team or Advisory Augmentation:** By the two-month mark, consider forming a small **Advisory Board**. This can be informal – e.g., invite 2–3 respected individuals (perhaps from the alignment field, or a legal expert, or a seasoned crypto economist) to regularly advise the lab. They need not be employees, but publicly announcing advisors can boost credibility and provide the founder with sounding boards. It mitigates key-man risk intellectually. This can be done at low cost (advisors often work for a token honorarium or future options). If actual hiring is feasible (maybe a part-time community manager or research assistant if finances allow), this would also be the time to bring them in as things ramp up.
- **Product Development - Bunny Land & Cards:** Use this period to strengthen the *tangible* aspects of the project. For Bunny Land, perhaps release an updated **Bunny Land Constitution 2.0** or a mini-report on what Bunny Land achieved in Q1. For the trading cards, you *should* aim to produce or acquire a new set of interesting data or cards (e.g., a rare card index update) and share it. This could be both content and product – maybe announce a **limited sale of a new metal card design** (with maybe a preference or discount for token holders/patrons). This kind of product activity will keep the alt-asset side engaged and demonstrate follow-through on that front.
- **AI Research Output:** By the end of March, plan to publish a **notable AI alignment research piece** in a public forum (could be an academic pre-print, a technical blog, or at minimum a detailed LinkedIn article). The reason: to ensure the lab is seen as continuing core alignment work, not just token management. Possible topic could be analysis of red-team results from Bunny Land or a piece on “Civic Holodeck” (from user files like Civilizational Design Protocol). This will cater to the alignment community and showcase the lab's dual mandate in action.
- **Community Growth Initiative:** Implement a strategy to grow the community modestly but surely. For instance, *should* start a **referral or ambassador program** for BUNI or Bunny Land: incentivize existing supporters to bring one friend or colleague into the Telegram or to attend an event. Or launch a small contest (maybe a meme contest but aligned with the project's themes, e.g., “best infographic explaining Bunny Land wins a collectible”). This will keep momentum and make new folks feel welcome. It's low-cost and strengthens resilience by enlarging the supporter base.

- **Could:**

- **Exchange Listing Exploration:** If liquidity and interest have grown, consider reaching out to a reputable centralized exchange or DEX for a secondary listing of BUNI. This is a delicate step – could be done quietly to gauge interest. It's not a must in 60 days, but exploring doesn't hurt. Perhaps Axiom Exchange (tagged earlier) could be an option; by now BUNI's track record of stable, non-hype trading might appeal to an exchange focusing on innovative tokens. Listing would increase access (good for volume) but also speculation (risk), so weigh it.
- **Collaborative Research with External Partners:** Use connections (maybe through PIXEL or alignment network) to start a joint research project – e.g., propose a *paper or experiment in collaboration with a university lab*. This is a “could” because it's only feasible if a willing partner is

found. But if, say, some students or a professor show interest in Bunny Land's governance model, doing a formal study or pilot with them could yield credibility (and publication) beyond the crypto sphere.

- **Tech Development – Automation:** If the founder finds time or an external developer, it could be useful to develop a **dashboard or smart contract** that automates some transparency tasks. For example, a simple Solana program that holds the treasury and automatically publishes its balance to a webpage, or a bot that posts weekly treasury updates to Telegram. This kind of tool would reinforce trust and reduce manual work. It's optional, but aligns with the on-chain logging ethos and would impress the technically savvy stakeholders.

#### **Next 90 Days (by end of Apr 2026):**

##### **- Must:**

- **Strategic Decision on Token Second Phase:** Around mid-April will be the 3-month point post-launch. The lab must decide and **publicly communicate** whether it will: (a) Mint any new tokens (and why), (b) Keep the status quo for another defined period, or (c) Burn/retire some authorized tokens (unlikely, but a gesture if wanting to cement a cap). Given the milestone approach, likely the decision is to *not* mint any new tokens at 3 months, because hitting major milestones in just one quarter is unlikely. If so, craft a clear message to holders: e.g., "We will not issue additional BUNI until [milestone] is achieved; our next review will be at the 6-month mark (July 2026)." This clarity will set expectations and prevent rumors. If by some chance milestones are met and lab does want to issue more (to raise funds for scaling), then a plan for a secondary offering must be prepared (with all disclosures) – that's a big task, thus the default assumed is no new issuance now.

- **FY2025 Audit Publication & FY2026 Q1 Financials:** By end of April (which is just after Q1 end), the lab must release the **FY2025 detailed financial report** (if not already in due diligence report) perhaps with third-party verification or at least more granularity, and a brief Q1 2026 financial summary. This maintains the quarterly cadence and provides concrete numbers to evaluate progress. Include info like Patreon revenue, card sales, trading income, expenses (even if minimal), and the current valuation of the treasury (to show how runway is). This level of openness will likely exceed what most startups do and thereby continue to build institutional trust.

- **Policy and Governance Updates:** If any **governance changes** are needed after 3 months (for example, adding an advisor triggers need to update company's ACRA filings or Bunny Land constitution changes), ensure they are done and transparent. Essentially, conduct a "governance spring cleaning." Also, given risk of centralization, consider formalizing some governance documents: e.g., publish an *AbsurdSenapiii Labs Charter* that outlines how decisions are made, how community input is considered, conflict of interest policies, etc. It doesn't have legal force like a corporate bylaw for token holders, but it sets normative expectations. If this is done, it must be by 90 days while initial momentum is there, to inoculate against future disputes.

##### **• Should:**

- **Major Research/Innovation Milestone:** Plan to hit at least one *tangible research or product milestone* by the 90-day mark. This could vary based on domain: maybe the lab can unveil a **prototype AI alignment tool** (even if simple, like a new metric or a piece of software for red-teaming GPT models) or publish a **paper** in an academic archive/conference or achieve a notable result in the trading card domain (like broker a partnership with an anime IP for card creation). Essentially, by 90 days, have one achievement that can be externally recognized beyond the crypto sphere. This will validate the lab's multi-domain strategy. For instance, a paper accepted to an AI workshop would show the lab's alignment research has merit; or a partnership with a game store for Bunny Land cards would show business traction.
- **Scale Community Governance (Bunny Land):** If Bunny Land has been running with a small cohort, now is the time to attempt scaling it or extracting lessons. *Should* organize a **Bunny Land General Assembly** or similar event around this time, inviting new citizens (perhaps some token

holders to join the experiment). Use it to test the governance framework at a slightly larger scale and document what works. After 90 days of the lab token, it would be poetic to integrate the two communities a bit, e.g., allow BUNI holders to observe or participate in a Bunny Land vote (without merging governance, just as a collaborative exercise). This strengthens the narrative that the token isn't just abstract but ties to on-ground experiments in governance.

- **Evaluate Hiring or Acceleration Needs:** Re-assess manpower and expertise gaps. By late April, if the project is meeting success metrics (growing community, stable token, active research output), it may justify transitioning from “founder alone” to at least “founder + help.” *Should* prepare job descriptions for roles you anticipate needing (e.g., Community Manager, Research Analyst). Even if you don't hire immediately, having them ready means you can quickly react if funding improves or workload becomes untenable. Also, consider applying to an **accelerator or grant** formally if appropriate – e.g., if PIXEL or others have grant calls open in Q2.
- **Strengthen External Partnerships:** By the 90-day mark, solidify one **external partnership** that was in exploratory phase. If none yet, target something like a Memorandum of Understanding (MoU) with, say, a university AI lab, or a formal affiliate partnership with a bigger crypto project (maybe a DAO that aligns with Bunny Land's aims, etc.). One concrete partnership will give the lab a boost in resources or visibility. For example, if the lab could partner with an AI non-profit to jointly run a red-team event, that adds credibility. The aim is not to fundraise but to embed the lab in a larger network.
- **Could:**
  - **Token Utility Experiment:** Introduce a small **utility for BUNI token** within the lab's ecosystem, purely optional but showcasing potential. For instance, allow BUNI holders to access a private channel with more frequent updates, or vote on which topic the next After Dark research should cover. This gently increases the token's use-case beyond holding, without turning it into a full governance token (which it isn't yet). This could be done via a snapshot poll or a bot verifying holdings. It's not required but could deepen engagement and give a glimpse of future decentralized governance plans.
  - **Audit/Third-Party Review:** By 90 days, if feasible, engage a respected third-party to do a **review of the project** – could be a security audit of the token contract (likely already safe since Soar provided, but an external stamp never hurts), or an independent evaluation of the Bunny Land governance experiment by an academic. If budget is an issue, consider exchanging tokens or just seeking a pro bono review (some professors might be interested to write about it). Getting an external validation will help when approaching bigger partners later.
  - **UN/SDG Alignment Report:** Since the lab aligns with UN SDGs in ethos <sup>120</sup>, one optional but impactful step: prepare a **brief for UN or public sector audience** by the 90-day mark. This could take the form of an open letter or whitepaper that specifically maps lab's activities to SDG goals (e.g., SDG 16 Peace/Justice via good governance in Bunny Land, SDG 9 Innovation via novel financing, etc.). Such a document can be shared within UN networks or at least on LinkedIn. It preempts questions about “how does this crypto-alignment lab help the world?” in language policymakers understand. While not a direct operational need, this could attract positive attention and perhaps future grants or collaborations from international bodies.

This 30-60-90 plan is intentionally **cautious yet forward-leaning**. It emphasizes maintaining transparency and stability (the foundation of the lab's credibility) in the near term, while gradually building structures (team, partnerships, token utility) to enable growth. By following this plan, AbsurdSenapiii Labs can reinforce stakeholder confidence after the initial launch excitement, guard against foreseeable risks, and position itself for scaled impact in the latter half of 2026. Each “Must” item addresses a critical risk or obligation, each “Should” item pushes the project toward strategic goals, and each “Could” item explores an opportunity that could further strengthen the project if resources

allow. The lab's leadership should periodically review progress against this plan, adjusting as needed but aiming to meet the Musts and most Shoulds to stay on track toward its ambitious vision.

### **Conflict Log (Source Discrepancies & Resolutions)**

*(Despite the project's high transparency, minor discrepancies between sources were noted. This log documents such conflicts and how we resolved or interpreted them.)*

- **Circulating Supply Figure:** The launch documentation states 50,000,000 BUNI were made available to the public <sup>3</sup>, yet the SOAR platform displayed a circulating supply of 49,999,497 BUNI as of late Jan <sup>122</sup> <sup>123</sup>. **Resolution:** The ~503 BUNI difference is negligible (<0.001% of supply) and likely due to technical rounding or a small portion remaining unpurchased in the bonding curve contract. It does not materially affect any conclusions. We treated "~50M" as the float, acknowledging this tiny discrepancy.
- **Launch Date Communication:** Some social media indicated the token launch was "formalised" on **Jan 18, 2026** (perhaps in a time zone or pre-announcement context) <sup>124</sup>, whereas official records and the executed contract are dated **Jan 19, 2026** <sup>31</sup> <sup>125</sup>. **Resolution:** We treat Jan 19, 2026 (SGT) as the official launch date (when trading actually began and contract was signed). The Jan 18 reference likely corresponds to announcement timing or UTC difference. We consistently use 19 Jan in this report to avoid confusion, aligning with Singapore local date.
- **Financial Figures in 2025 Report:** The lab's overview mentions "~\$50K revenue" in 2025 <sup>109</sup>, broken down as \$30K affiliate/partnership and \$20K trading income. However, the **Annual Report artifact** (not fully provided) might have more precise figures and expenses that weren't quoted in overview. **Resolution:** In absence of the full report, we cited the summary provided <sup>109</sup>. We assume those numbers are approximate (hence the use of "~"). No conflicting figure is available, but if the full report later shows, say, \$48K vs \$50K, it falls within rounding. We flagged it as approximate and confidence high that it's in that range.
- **Affiliate Revenue Allocation:** The founder's tweet says "~80-90%" of affiliate revenue goes to growth <sup>38</sup>, which is a broad range. In practice, whether it's 80% or 90% is not specified in any static document. **Resolution:** We treated this as a policy statement rather than an exact accounting figure. No conflict per se, but an ambiguity – we presented it qualitatively ("the majority goes to development") and cited the range as given. It doesn't affect any critical calculation, just noted as an approximate policy.
- **Bunny Land Independence:** The sources credit Bunny Land's innovations to AbsurdSenapiii Labs (since it's founder-led) <sup>105</sup>, but it's not clear if Bunny Land's community would describe it as dependent or as its own entity. **Resolution:** We didn't find external sources from Bunny Land's perspective. We chose to describe Bunny Land as an experiment under the lab's leadership <sup>126</sup>, per the lab's own documents. This could be contentious if Bunny Land participants view it differently, but without their input, we stick to the lab's characterization and treat any potential difference in portrayal as not a factual conflict but rather perspective.
- **Token Buyback Quantification:** The founder mentioned a 3M BUNI buyback in qualitative terms <sup>36</sup>. We have not seen an exact transaction hash confirming 3,000,000 tokens. It's possible the actual number was slightly different (e.g., 2.95M). **Resolution:** We reported "~3 million" to capture the scale without asserting an exact figure beyond what was stated. Given no one has refuted it and the statement is from the founder, we accept it, but use approximation to be safe.

- **Social Media Tone vs. Formal Docs:** There's a contrast between the formal tone in reports and a sometimes irreverent tone on Twitter (including humor and personal remarks). An outside observer might find this conflicting in terms of brand voice. **Resolution:** We addressed this in reputational risk rather than facts. It's not a factual discrepancy but a style difference. We took care to use the appropriate tone for each source when citing (i.e., we did not quote jokes in the main narrative, only factual content).
- **Absence of Independent Verification:** Nearly all information comes from the lab itself (by design of transparency). A skeptic might say, "How do we know the Annual Report is accurate without third-party audit?". While not a conflict between sources, it's a potential conflict between stated fact and trust. **Resolution:** We mitigated this by noting confidence levels and by highlighting in unknowns that some data hasn't been externally verified. Where multiple internal sources agreed (overview and LinkedIn and PDF), we boosted confidence. Ultimately, we did not find any two sources that gave directly contradictory figures or claims. The consistency of information is high – our cross-checking found alignment, which in itself is reassuring.

In conclusion, **no material conflicts in quantitative or event data were found** across the connected sources. Minor numerical quirks and timing differences were resolved with clarifying assumptions as noted. The lab's commitment to publishing everything publicly likely reduced typical discrepancies (there is "one source of truth" set by the founder's communications). We have recorded the few minor issues above primarily for completeness and to show due diligence. Should any conflicting information arise (for example, if a future audit revises a figure or a partner contradicts a claim), that would be added to an updated conflict log. As of this reporting window, AbsurdSenapiii Labs' narrative appears internally consistent across its multiple platforms and documents <sup>34</sup> <sup>91</sup>, which strengthens the credibility of this compiled progress account.
